REGIØARDO

 **REGIN**
THE CHALLENGER

THANK YOU FOR CHOOSING REGIN!

Ever since Regin was established in 1947, we have developed and marketed products and systems that create good levels of indoor comfort. Today, we are an important player with one of the market's broadest ranges for building automation.

Our goal is to make real estates in the world more energy efficient. Regin is an international group and our products sell in over 90 countries. Thanks to our global presence with strong local representation, we are well aware of the requirements of the market, as well as of how our products and systems function under the most variable conditions. Every year, Regin makes substantial investments in the development of our systems and HVAC-products.

DISCLAIMER

The information in this manual has been carefully checked and is believed to be correct. | Introduction

Regio^{Ardo} is a 24 V AC two-room controller with a pre-programmed software application for dampers, chilled beams, and radiators. The controller provides built-in communication via EXOline, Modbus, or BACnet for integration in EXOscada or other SCADA systems. The controller is fast and easy to configure and commission using Regin's free Application tool software, and it connects seamlessly to the room units in Regin's ED-RU... series. The controller is installed in a ceiling void by using a baseplate with terminal protection covers, or on a DIN rail.

|.1 About this manual

This manual provides descriptions of the Regio^{Ardo} controller functions, as well as hardware-related information concerning controller connections, wiring, mounting, maintenance and service, and so on.

Regio^{Ardo} is configured and commissioned by using Regin's Application tool software. The controller functions and their configuration options are therefore described in an Application tool context.

The manual has the following high-level section structure:

- ✓ Sections 2-6 contain descriptions of and configuration information for controller functions, such as:
 - ✓ Heating, cooling, and variable air volume (VAV) controller modes
 - ✓ Controller states
 - ✓ Fan control
 - ✓ CO₂ control
 - ✓ Presence detection
 - ✓ Change-over
 - ✓ Two rooms
 - ✓ Removable walls
- ✓ Sections 7-10 contain hardware-related information topics, such as:
 - ✓ Controller connections and wiring diagrams
 - ✓ LED status indications
 - ✓ Mounting
 - ✓ Maintenance and service
- ✓ The Appendix sections contain the following information:
 - ✓ Technical data
 - ✓ Room unit display parameter lists
 - ✓ Modbus signal lists
 - ✓ BACnet signal lists

Special text formats used in the manual:

Note! This box and symbol is used to show useful tips and tricks.

Caution! This type of text and symbol is used to show cautions.

Introduction

Warning! This type of text and symbol is used to show warnings.

2 Control functions

This section contains descriptions of and configuration information for the controller's basic control functions.

2.1 Controller mode

The controller mode function enables the controller to support control of various room HVAC systems, that is, different combinations of heating, cooling, and variable air volume (VAV) devices that are part of a room.

The controller provides the following 10 selectable controller modes:

- ✓ Heating
- ✓ Heating + Heating
- ✓ Heating + Cooling
- ✓ Cooling
- ✓ Heating/Cooling (change-over)
- ✓ Heating + Heating/Cooling (change-over)
- ✓ Heating + VAV
- ✓ Cooling + VAV
- ✓ VAV
- ✓ Heating + Cooling + VAV

Based on the selected controller mode, the controller outputs one or multiple control signal sequences, denoted Y1, Y2, and Y3. The signal sequences control the heating, cooling, and VAV devices in the room, and are assigned to the different controller outputs via configuration.

Figure 2-1 shows the drop down that is used to select a controller mode in Application tool.

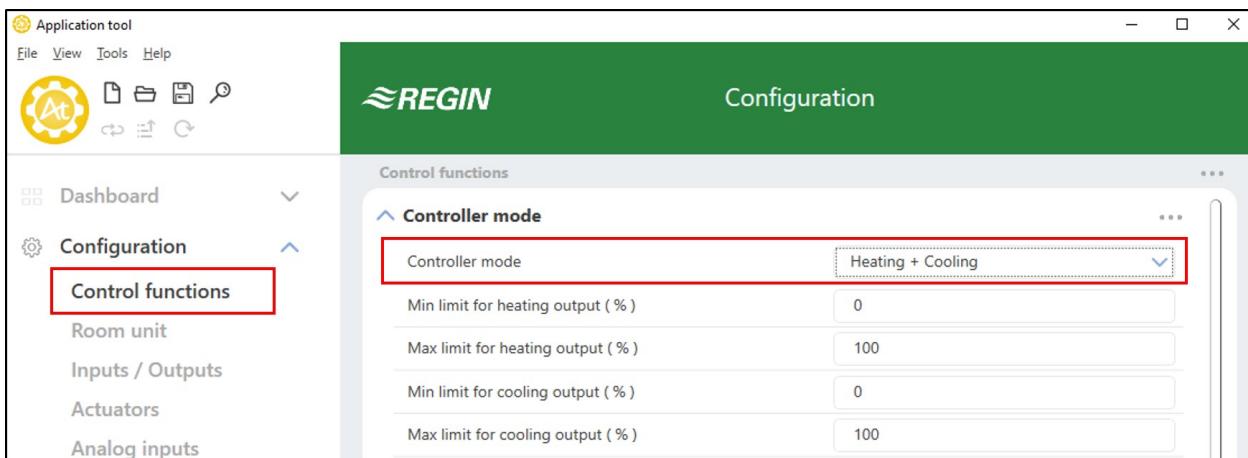

Figure 2-1 Controller mode selection in Application tool.

2.1.1 Heating

This controller mode is suitable for room HVAC systems that use a radiator or fan coil as heating device.

The controller acts as a heating controller and regulates based on the heating setpoint and the current room temperature.

Control functions

The controller is always in heating mode and outputs a heating signal, Y1, that is configured on the controller outputs by using the configuration values listed in *Table 2-1*.

Maximum and minimum limits for the output signal can be set, see section 2.2.

Table 2-1 Controller output configuration values and controller output types.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | Heating | Analog |
| | Heating valve, increase | Digital |
| | Heating valve, decrease | Digital |
| | Heating valve, thermal (PWM) | Digital |

Figure 2-2 illustrates the control behaviour for this controller mode when no maximum or minimum limits are set.

The heating demand increases as the room temperature falls. When the room temperature falls below the heating setpoint, Y1: *Heating signal* increases to respond to the heating demand. At 100% heating demand, Y1: *Heating signal* reaches its maximum.

When the room temperature is higher than the heating setpoint and no heating demand exists, Y1: *Heating signal* is at its minimum.

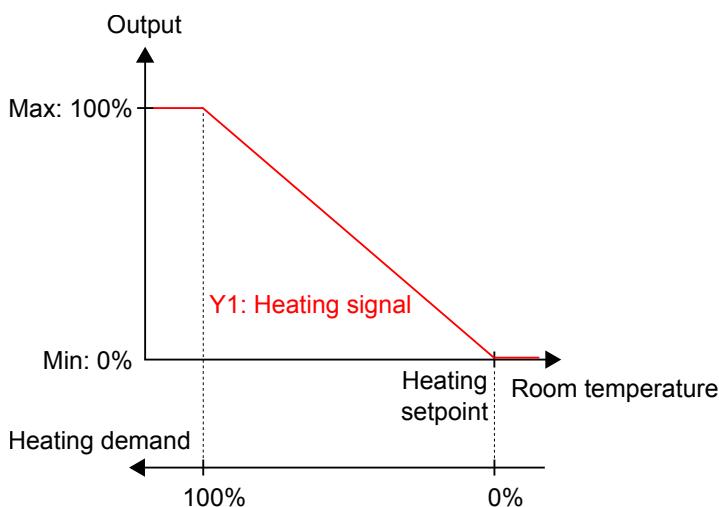

Figure 2-2 Control behaviour for the Heating controller mode.

2.1.2 Heating + Heating

This controller mode is suitable for room HVAC systems that use a combination of two heating devices in sequence, such as radiators or fan coils.

The controller acts as a heating controller and regulates based on the heating setpoint and the current room temperature.

The controller is always in heating mode and outputs two heating signals, Y1 and Y2, in sequence that are configured on the controller outputs by using the configuration values listed in table *Table 2-2*.

The Y1 and Y2 signal sequence order is configurable.

Maximum and minimum limits for the output signals can be set, see section 2.2.

Table 2-2 Controller output configuration values and controller output types.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | Heating | Analog |
| | Heating valve, increase | Digital |
| | Heating valve, decrease | Digital |
| | Heating valve, thermal (PWM) | Digital |
| Y2 | Heating 2 | Analog |
| | Heating valve 2, increase | Digital |
| | Heating valve 2, decrease | Digital |
| | Heating valve 2, thermal (PWM) | Digital |

Figure 2-3 illustrates the control behaviour for this controller mode when no maximum or minimum limits are set.

The heating demand increases as the room temperature falls. When the room temperature falls below the heating setpoint, Y1: Heating signal increases to respond to the heating demand. At 49% heating demand, Y1: Heating signal reaches its maximum. When the room temperature falls further and the heating demand exceeds 51%, Y2: Heating 2 signal increases while Y1: Heating signal stays at its maximum. At 100% heating demand, Y2: Heating signal reaches its maximum.

When the room temperature is higher than the heating setpoint and no heating demand exists, both Y1: Heating signal and Y2: Heating 2 signal are at their minimum.

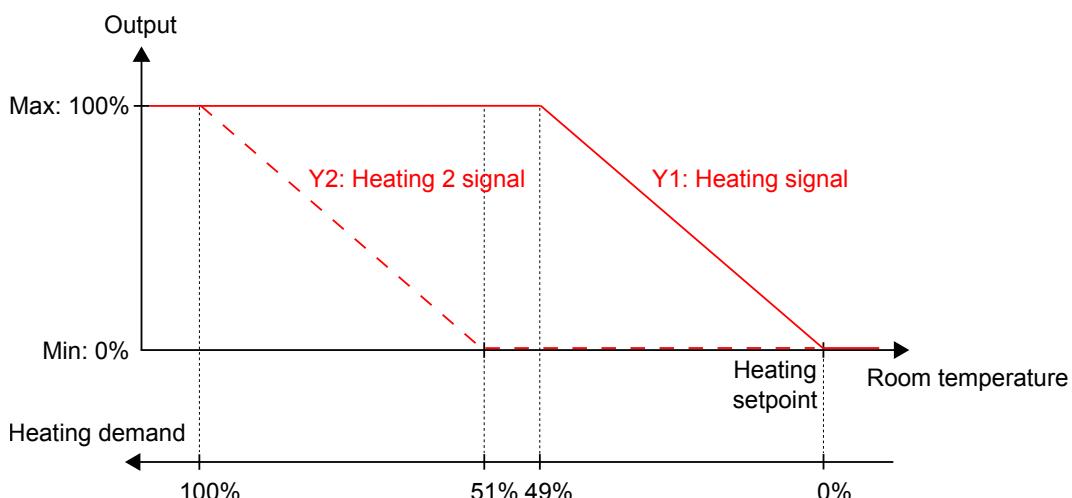

Figure 2-3 Control behaviour for the Heating + Heating controller mode.

2.1.3 Heating + Cooling

This controller mode is suitable for room HVAC systems that use a radiator or fan coil as heating device, and a fan coil or chilled beam as cooling device.

The controller acts as a heating and cooling controller and regulates based on the heating setpoint, cooling setpoint, and the current room temperature.

The temperature range between the heating and cooling setpoints is defined as the deadband. The controller is in heating mode when the room temperature is lower than [heating setpoint plus half the deadband], and in cooling mode when the room temperature is higher than [cooling setpoint minus half the deadband].

When in heating mode, the controller outputs a heating signal, Y1, that is configured on the controller outputs by using the values listed in Table 2-3.

Control functions

When in cooling mode, the controller outputs a cooling signal, Y2, that is configured on the controller outputs by using the values listed in *Table 2-3*.

Maximum and minimum limits for the output signals can be set, see section 2.2.

Table 2-3 Controller output configuration values and controller output types.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | Heating | Analog |
| | Heating valve, increase | Digital |
| | Heating valve, decrease | Digital |
| | Heating valve, thermal (PWM) | Digital |
| Y2 | Cooling | Analog |
| | Cooling valve, increase | Digital |
| | Cooling valve, decrease | Digital |
| | Cooling valve, thermal (PWM) | Digital |
| Y1 + Y2 | 6-way valve | Analog |
| | 6-way valve, increase | Digital |
| | 6-way valve, decrease | Digital |

Figure 2-4 illustrates the control behaviour for this controller mode when no maximum or minimum limits are set.

The heating demand increases as the room temperature falls. When the room temperature falls below the heating setpoint, Y1: *Heating signal* increases to respond to the heating demand. At 100% heating demand, Y1: *Heating signal* reaches its maximum. When the room temperature is in the range between the heating setpoint and the deadband centre, and no heating demand exists, Y1: *Heating signal* is at its minimum.

The cooling demand increases as the room temperature rises. When the room temperature rises above the cooling setpoint, Y2: *Cooling signal* increases to respond to the cooling demand. At 100% cooling demand, Y2: *Cooling signal* reaches its maximum. When the room temperature is in the range between the cooling setpoint and the deadband centre, and no cooling demand exists, Y2: *Cooling signal* is at its minimum.

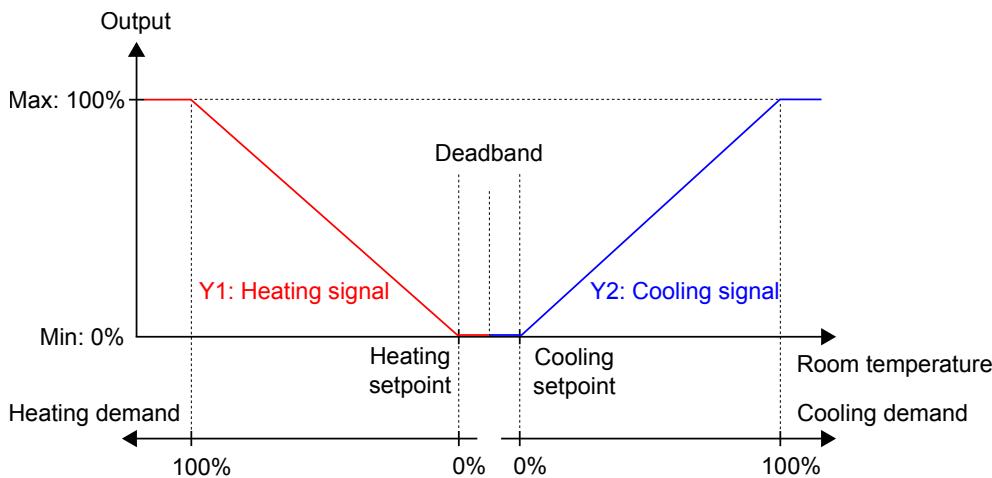

Figure 2-4 Control behaviour for the Heating + Cooling controller mode.

2.1.4 Cooling

This controller mode is suitable for room HVAC systems that use a fan coil or a chilled beam as cooling device.

The controller acts as a cooling controller and regulates based on the cooling setpoint and the current room temperature.

The controller is always in cooling mode and outputs a cooling signal, Y1, that is configured on the controller outputs by using the configuration values listed in *Table 2-4*.

Maximum and minimum limits for the output signal can be set, see section 2.2.

Table 2-4 Controller output configuration values and controller output types.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | Cooling | Analog |
| | Cooling valve, increase | Digital |
| | Cooling valve, decrease | Digital |
| | Cooling valve, thermal (PWM) | Digital |

Figure 2-5 illustrates the control behaviour for this controller mode when no maximum or minimum limits are set.

The cooling demand increases as the room temperature rises. When the room temperature rises above the cooling setpoint, Y1: *Cooling signal* increases to respond to the cooling demand. At 100% cooling demand, Y1: *Cooling signal* reaches its maximum.

When the room temperature is lower than the cooling setpoint and no cooling demand exists, Y1: *Cooling signal* is at its minimum.

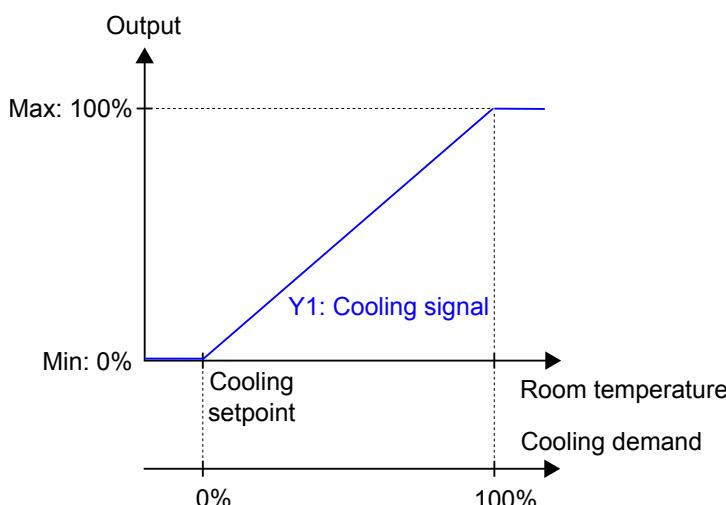

Figure 2-5 Control behaviour for the Cooling controller mode.

2.1.5 Heating/Cooling (change-over)

This controller mode is suitable for room HVAC systems that use a 2-pipe fan coil as heating and cooling device. The change-over function makes it possible to use the controller in a 2-pipe change-over system, where warm or cold media flow in the same pipes and one valve is used to regulate both heating and cooling distribution. See section 2.3 for information about the change-over function.

The controller acts as a heating or cooling controller and regulates based on the heating setpoint, cooling setpoint, and the current room temperature.

The controller is either in heating or cooling mode, and switches between the modes according to its current change-over state, see section 2.3.

When the controller is in heating or cooling mode, the controller outputs a heating or cooling signal, Y1, that is configured on the controller outputs by using the configuration values listed in *Table 2-5*.

Control functions

Maximum and minimum limits for the output signal can be set, see section 2.2.

Table 2-5 Controller output configuration values and controller output types.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | Change-over valve | Analog |
| | Change-over valve, increase | Digital |
| | Change-over valve, decrease | Digital |
| | Change-over valve, thermal (PWM) | Digital |

Figure 2-6 illustrates the control behaviour in heating mode, and when no maximum or minimum limits are set.

The heating demand increases as the room temperature falls. When the room temperature falls below the heating setpoint, Y1: *Change-over (heating mode) signal* increases to respond to the heating demand. At 100% heating demand, Y1: *Change-over (heating mode) signal* reaches its maximum.

When the room temperature is higher than the heating setpoint and no heating demand exists, Y1: *Change-over (heating mode) signal* is at its minimum.

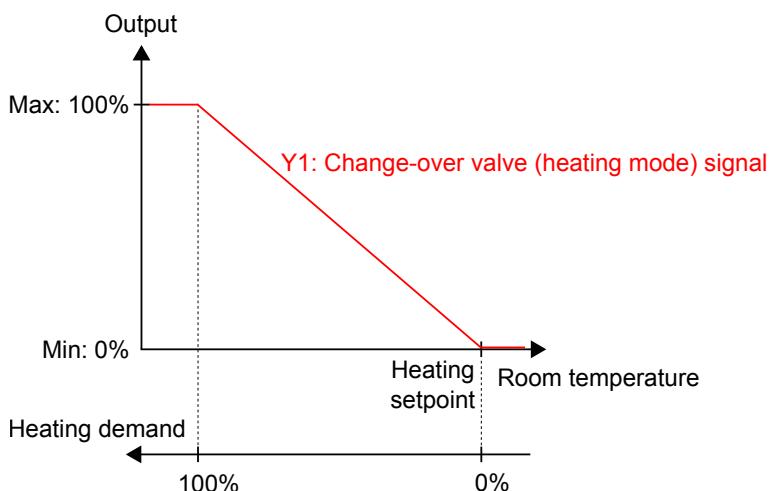

Figure 2-6 Control behaviour for the Heating/Cooling (change-over) controller mode when the controller is in heating mode.

Figure 2-7 illustrates the control behaviour in cooling mode, and when no maximum or minimum limits are set.

The cooling demand increases as the room temperature rises. When the room temperature rises above the cooling setpoint, Y1: *Change-over (cooling mode) signal* increases to respond to the cooling demand. At 100% cooling demand, Y1: *Change-over (cooling mode) signal* reaches its maximum.

When the room temperature is lower than the cooling setpoint and no cooling demand exists, Y1: *Change-over (cooling mode) signal* is at its minimum.

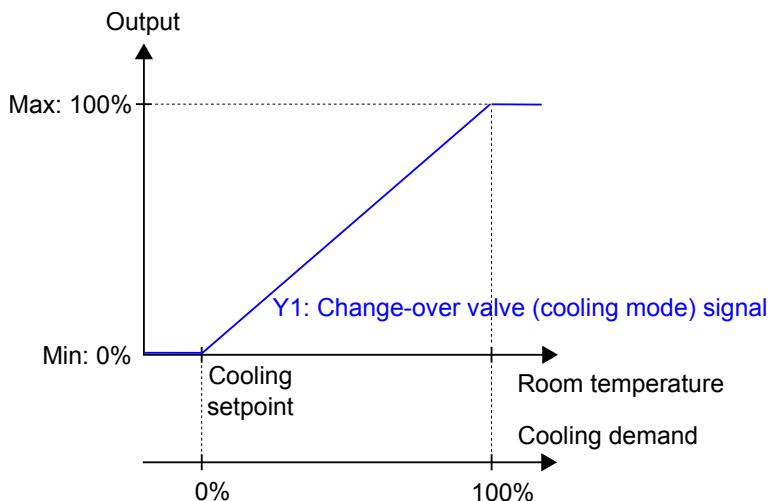

Figure 2-7 Control behaviour for the Heating/Cooling (change-over) controller mode when the controller is in cooling mode.

2.1.6 Heating + Heating/Cooling (change-over)

This controller mode is suitable for room HVAC systems that use a 2-pipe fan coil as heating and cooling device, and where an additional heating device, typically an electrical heating battery, is used to provide extra heating during cold seasons.

The controller is set to operate in either Heating + Heating mode or Heating + Cooling mode by using the change-over function. The change-over function makes it possible to use the controller in a 2-pipe change-over system, where warm or cold media flow in the same pipes and one valve is used to regulate both heating and cooling distribution. See section 2.3 for information about the change-over function.

The controller operates in Heating + Heating mode when the controller change-over state is *heating*, and in Heating + Cooling mode when the controller change-over state is *cooling*. See section 2.3 for information about the controller change-over state.

The Heating + Heating mode is typically used during cold seasons, such as winter. The Heating + Cooling mode is typically used during warm seasons, such as summer.

Heating + Heating mode

The controller acts as a heating controller and regulates based on the heating setpoint and the current room temperature.

The controller is always in heating mode and outputs two heating signals, Y1 and Y2, in sequence that are configured on the controller outputs by using the configuration values listed in table *Table 2-6*.

The Y1 output signal is associated with the 2-pipe fan coil and increases first to respond to the initial heating demand. The Y2 output signal is associated with the additional heating device and responds to any further heating demand that the 2-pipe fan coil cannot meet.

Maximum and minimum limits for the output signals can be set, see section 2.2.

Control functions

Table 2-6 Controller output configuration values and controller output types.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | Change-over valve | Analog |
| | Change-over valve, increase | Digital |
| | Change-over valve, decrease | Digital |
| Y2 | Change-over valve, thermal (PWM) | Digital |
| | Heating | Analog |
| | Heating valve, increase | Digital |
| | Heating valve, decrease | Digital |
| | Heating valve, thermal (PWM) | Digital |

Figure 2-8 illustrates the control behaviour for this mode when no maximum or minimum limits are set.

The heating demand increases as the room temperature falls. When the room temperature falls below the heating setpoint, Y1: *Change-over (heating mode) signal* increases to respond to the heating demand. At 49% heating demand, Y1: *Change-over (heating mode) signal* reaches its maximum. When the room temperature falls further and the heating demand exceeds 51%, Y2: *Heating signal* increases while Y1: *Change-over (heating mode) signal* stays at its maximum. At 100% heating demand, Y2: *Heating signal* reaches its maximum.

When the room temperature is higher than the heating setpoint and no heating demand exists, both Y1: *Change-over (heating mode) signal* and Y2: *Heating signal* are at their minimum.

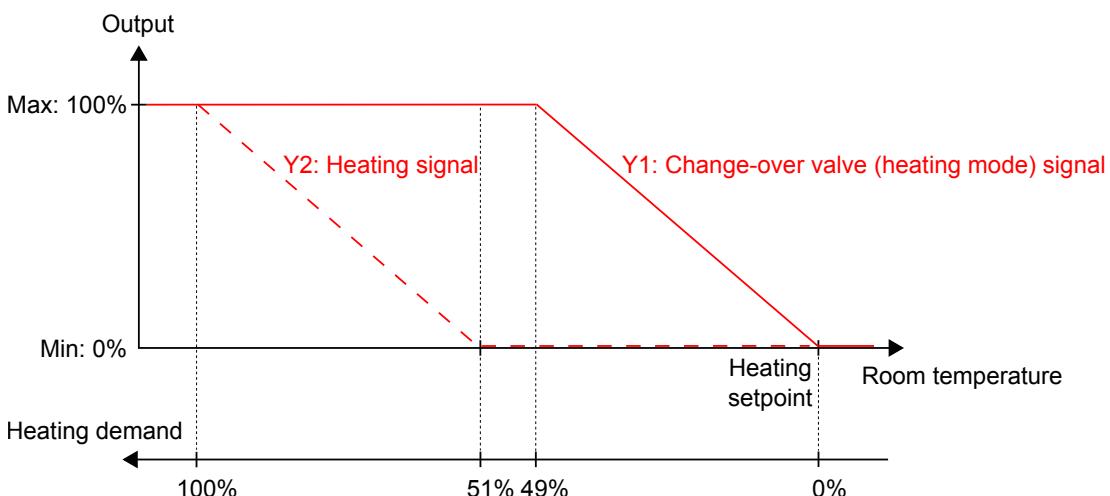

Figure 2-8 Control behaviour for the Heating + Heating/Cooling (change-over) controller mode when the controller is in Heating + Heating mode.

Heating + Cooling mode

The controller acts as a heating and cooling controller and regulates based on the heating setpoint, cooling setpoint, and the current room temperature.

The temperature range between the heating and cooling setpoints is defined as the deadband. The controller is in heating mode when the room temperature is lower than [heating setpoint plus half the deadband], and in cooling mode when the room temperature is higher than [cooling setpoint minus half the deadband].

When in cooling mode, the controller outputs a cooling signal, Y1, that is configured on the controller outputs by using the values listed in Table 2-3. The Y1 output signal is associated with the 2-pipe fan coil.

When in heating mode, the controller outputs a heating signal, Y2, that is configured on the controller outputs by using the values listed in Table 2-3. The Y2 output signal is associated with the additional heating device.

Maximum and minimum limits for the output signals can be set, see section 2.2.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | Change-over valve | Analog |
| | Change-over valve, increase | Digital |
| | Change-over valve, decrease | Digital |
| | Change-over valve, thermal (PWM) | Digital |
| Y2 | Heating | Analog |
| | Heating valve, increase | Digital |
| | Heating valve, decrease | Digital |
| | Heating valve, thermal (PWM) | Digital |

Figure 2-9 illustrates the control behaviour for this mode when no maximum or minimum limits are set.

The heating demand increases as the room temperature falls. When the room temperature falls below the heating setpoint, Y2: *Heating signal* increases to respond to the heating demand. At 100% heating demand, Y2: *Heating signal* reaches its maximum. When the room temperature is in the range between the heating setpoint and the deadband centre, and no heating demand exists, Y2: *Heating signal* is at its minimum.

The cooling demand increases as the room temperature rises. When the room temperature rises above the cooling setpoint, Y1: *Change-over (cooling mode) signal* increases to respond to the cooling demand. At 100% cooling demand, Y1: *Change-over (cooling mode) signal* reaches its maximum. When the room temperature is in the range between the cooling setpoint and the deadband centre, and no cooling demand exists, Y1: *Change-over (cooling mode) signal* is at its minimum.

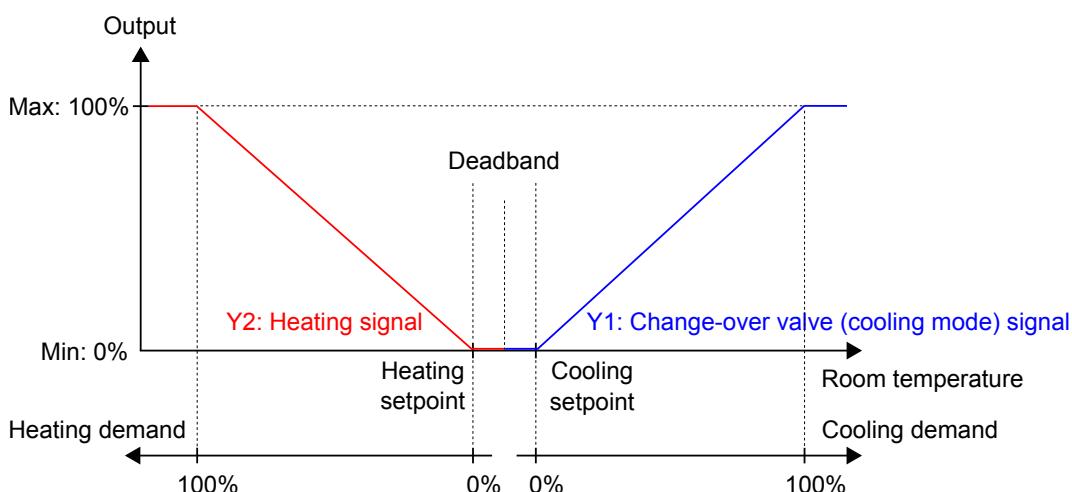

Figure 2-9 Control behaviour for the Heating + Heating/Cooling (change-over) controller mode when the controller is in Heating + Cooling mode.

2.1.7 Heating + VAV

This controller mode is suitable for room HVAC systems that use a radiator as heating device, and low supply air temperature that is distributed into the room via a diffuser damper to provide cooling and fresh air. The air must be pretreated and cooled, since the diffuser damper itself does not have any cooling capacity.

The controller acts as a heating and cooling controller and regulates based on the heating setpoint, cooling setpoint, and the current room temperature. In addition, the controller can be set to regulate based on fresh air demand instead of cooling demand, or based on cooling demand and fresh air demand simultaneously, see section 2.6. The controller regulates based on fresh air demand by using CO₂ control, see section 2.10.

Control functions

The temperature range between the heating and cooling setpoints is defined as the deadband. The controller is in heating mode when the room temperature is lower than [heating setpoint plus half the deadband], and in cooling mode when the room temperature is higher than [cooling setpoint minus half the deadband].

When in heating mode, the controller outputs both a heating signal, Y1, and a VAV signal, Y2, that are configured on the controller outputs by using the values listed in *Table 2-3*.

When in cooling mode, the controller outputs a VAV signal, Y2, that is configured on the controller outputs by using the value listed in *Table 2-3*.

Maximum and minimum limits for the heating output signal can be set, see section 2.2. Maximum and minimum limits for the VAV output signal are set via the VAV control function, see section 2.6.

Table 2-7 Controller output configuration values and controller output types.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | Heating | Analog |
| | Heating valve, increase | Digital |
| | Heating valve, decrease | Digital |
| | Heating valve, thermal (PWM) | Digital |
| Y2 | VAV | Analog |

Figure 2-10 illustrates the control behaviour when the controller regulates based on heating and cooling demand, when no maximum or minimum limits are set for the heating output signal, and when a minimum limit is set for the VAV output signal.

The heating demand increases as the room temperature falls. When the room temperature falls below the heating setpoint, Y1: *Heating signal* increases to respond to the heating demand. At 100% heating demand, Y1: *Heating signal* reaches its maximum. When the room temperature is in the range between the heating setpoint and the deadband centre, and no heating demand exists, Y1: *Heating signal* is at its minimum.

The cooling demand increases as the room temperature rises. When the room temperature rises above the cooling setpoint, Y2: *VAV signal* increases to respond to the cooling demand. At 100% cooling demand, Y2: *VAV signal* reaches its maximum. Y2: *VAV signal* never goes below its set minimum limit.

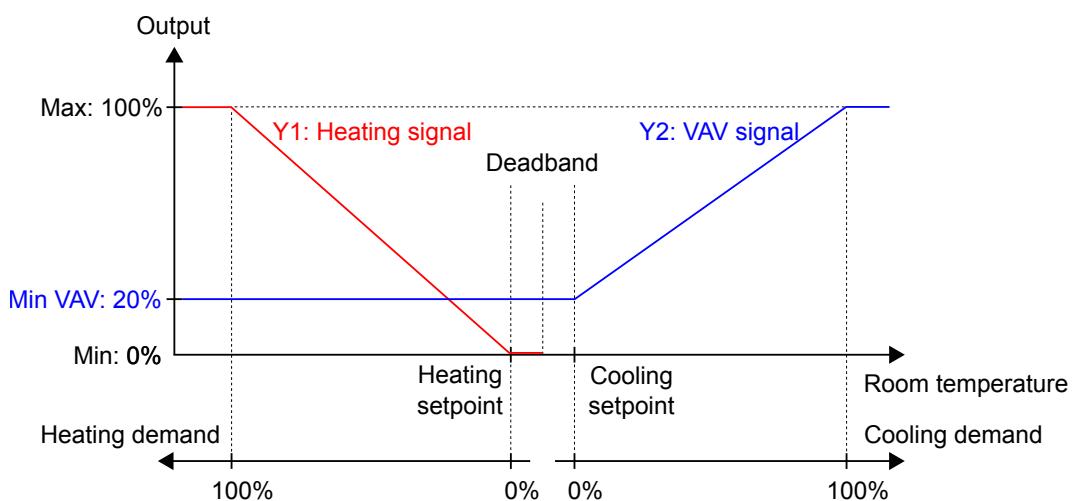

Figure 2-10 Control behaviour for the Heating + VAV controller mode when the controller regulates based on heating and cooling demand.

2.1.8 Cooling + VAV

This controller mode is suitable for room HVAC systems that use a chilled beam as cooling device, where the beam contains a cooling valve and a damper that regulates low supply air temperature that is distributed

into the room to provide cooling and fresh air. The air must be pretreated and cooled, since the damper itself does not have any cooling capacity.

The controller acts as a cooling controller and regulates based on the cooling setpoint and the current room temperature. In addition, the controller can be set to also regulate based on fresh air demand, or based on cooling demand and fresh air demand simultaneously, see section 2.6. The controller regulates based on fresh air demand by using CO₂ control, see section 2.10.

The controller is always in cooling mode and outputs a cooling signal, Y1, and a VAV signal, Y2, in sequence that are configured on the controller outputs by using the configuration values listed in table *Table 2-8*.

The Y1 and Y2 signal sequence order is configurable.

Maximum and minimum limits for the cooling output signal can be set, see section 2.2. Maximum and minimum limits for the VAV output signal are set via the VAV control function, see section 2.6.

Table 2-8 Controller output configuration values and controller output types.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | Cooling | Analog |
| | Cooling valve, increase | Digital |
| | Cooling valve, decrease | Digital |
| | Cooling valve, thermal (PWM) | Digital |
| Y2 | VAV | Analog |

Figure 2-11 illustrates the control behaviour when the controller regulates based on cooling demand, when no maximum or minimum limits are set for the cooling output signal, and when a minimum limit is set for the VAV output signal.

The cooling demand increases as the room temperature rises. When the room temperature rises above the cooling setpoint, Y1: *Cooling signal* increases to respond to the cooling demand. At 49% cooling demand, Y1: *Cooling signal* reaches its maximum. When the room temperature rises further and the cooling demand exceeds 51%, Y2: *VAV signal* increases while Y1: *Cooling signal* stays at its maximum. At 100% cooling demand, Y2: *VAV signal* reaches its maximum.

When the room temperature is lower than the cooling setpoint and no cooling demand exists, both Y1: *Cooling signal* and Y2: *VAV signal* are at their minimum.

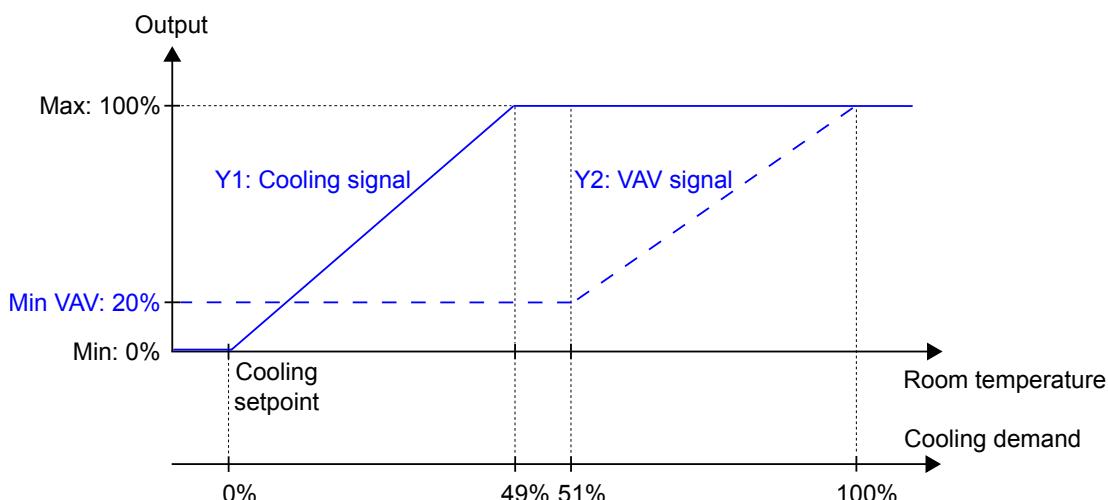

Figure 2-11 Control behaviour for the Cooling + VAV controller mode when the controller regulates based on cooling demand.

2.1.9 VAV

This controller mode is suitable for room HVAC systems that use low supply air temperature that is distributed into the room via a diffuser damper to provide cooling and fresh air. The air must be pretreated and cooled, since the diffuser damper itself does not have any cooling capacity.

The controller acts as a cooling controller and regulates based on the cooling setpoint and the current room temperature. In addition, the controller can be set to regulate based on fresh air demand instead of cooling demand, or based on cooling demand and fresh air demand simultaneously, see section 2.6. The controller regulates based on fresh air demand by using CO₂ control, see section 2.10.

The controller is always in cooling mode and outputs a VAV signal, Y1, that is configured on the controller outputs by using the configuration value listed in *Table 2-9*.

Maximum and minimum limits for the VAV output signal are set via the VAV control function, see section 2.6.

Table 2-9 Controller output configuration value and controller output type.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | VAV | Analog |

Figure 2-12 illustrates the control behaviour when the controller regulates based on cooling demand, and when a minimum limit is set for the VAV output signal.

The cooling demand increases as the room temperature rises. When the room temperature rises above the cooling setpoint, Y1: *VAV signal* increases to respond to the cooling demand. At 100% cooling demand, Y1: *VAV signal* reaches its maximum.

When the room temperature is lower than the cooling setpoint and no cooling demand exists, Y1: *VAV signal* is at its minimum.

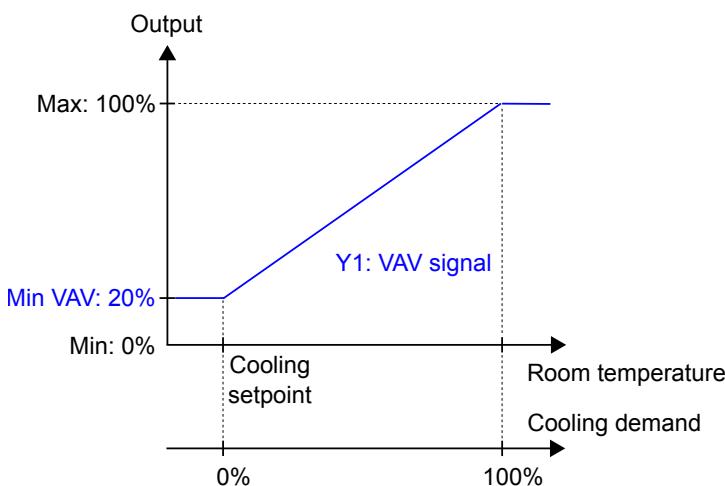

Figure 2-12 Control behaviour for the VAV controller mode when the controller regulates based on cooling demand.

2.1.10 Heating + Cooling + VAV

This controller mode is suitable for room HVAC systems that use a radiator as heating device and a chilled beam as cooling device, where the beam contains a cooling valve and a damper that regulates low supply air temperature that is distributed into the room to provide cooling and fresh air. The air must be pretreated and cooled, since the damper itself does not have any cooling capacity.

The controller acts as a heating and cooling controller and regulates based on the heating setpoint, cooling setpoint, and the current room temperature. In addition, the controller can be set to also regulate based on

fresh air demand, or based on cooling demand and fresh air demand simultaneously, see section 2.6. The controller regulates based on fresh air demand by using CO₂ control, see section 2.10.

The temperature range between the heating and cooling setpoints is defined as the deadband. The controller is in heating mode when the room temperature is lower than [heating setpoint plus half the deadband], and in cooling mode when the room temperature is higher than [cooling setpoint minus half the deadband].

When in heating mode, the controller outputs both a heating signal, Y1, and a VAV signal, Y3, that are configured on the controller outputs by using the values listed in *Table 2-10*.

When in cooling mode, the controller outputs a cooling signal, Y2, and a VAV signal, Y3, in sequence that are configured on the controller outputs by using the configuration values listed in *Table 2-10*.

The Y2 and Y3 signal sequence order is configurable.

Maximum and minimum limits for the heating and cooling output signals can be set, see section 2.2.

Maximum and minimum limits for the VAV output signal are set via the VAV control function, see section 2.6.

Table 2-10 Controller output configuration values and controller output types.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | Heating | Analog |
| | Heating valve, increase | Digital |
| | Heating valve, decrease | Digital |
| | Heating valve, thermal (PWM) | Digital |
| Y2 | Cooling | Analog |
| | Cooling valve, increase | Digital |
| | Cooling valve, decrease | Digital |
| | Cooling valve, thermal (PWM) | Digital |
| Y1 + Y2 | 6-way valve | Analog |
| | 6-way valve, increase | Digital |
| | 6-way valve, decrease | Digital |
| Y3 | VAV | Analog |

Figure 2-13 illustrates the control behaviour when the controller regulates based on heating and cooling demand, when no maximum or minimum limits are set for the heating or cooling output signals, and when a minimum limit is set for the VAV output signal.

The heating demand increases as the room temperature falls. When the room temperature falls below the heating setpoint, Y1: *Heating signal* increases to respond to the heating demand. At 100% heating demand, Y1: *Heating signal* reaches its maximum. When the room temperature is in the range between the heating setpoint and the deadband centre, and no heating demand exists, Y1: *Heating signal* is at its minimum.

The cooling demand increases as the room temperature rises. When the room temperature rises above the cooling setpoint, Y2: *Cooling signal* increases to respond to the cooling demand. At 49% cooling demand, Y2: *Cooling signal* reaches its maximum. When the room temperature rises further and the cooling demand exceeds 51%, Y3: *VAV signal* increases while Y2: *Cooling signal* stays at its maximum. At 100% cooling demand, Y3: *VAV signal* reaches its maximum. When the room temperature is in the range between the cooling setpoint and the deadband centre, and no cooling demand exists, both Y2: *Cooling signal* and Y3: *VAV signal* are at their minimum.

Y3: *VAV signal* never goes below its set minimum limit.

Control functions

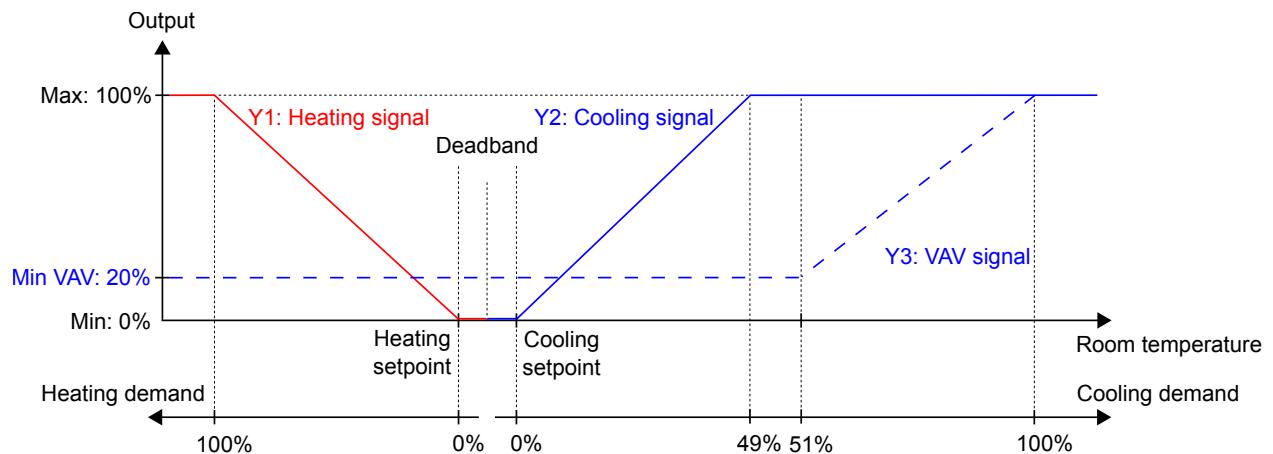

Figure 2-13 Control behaviour for the Heating + Cooling + VAV controller mode when the controller regulates based on heating and cooling demand.

2.2 Maximum and minimum limits for heating and cooling output

Maximum and minimum limits for the heating and cooling output signals can be set. *Figure 2-14* shows the configuration settings in Application tool.

Maximum and minimum limits for the VAV output signal are set via the VAV control function, see section 2.6.

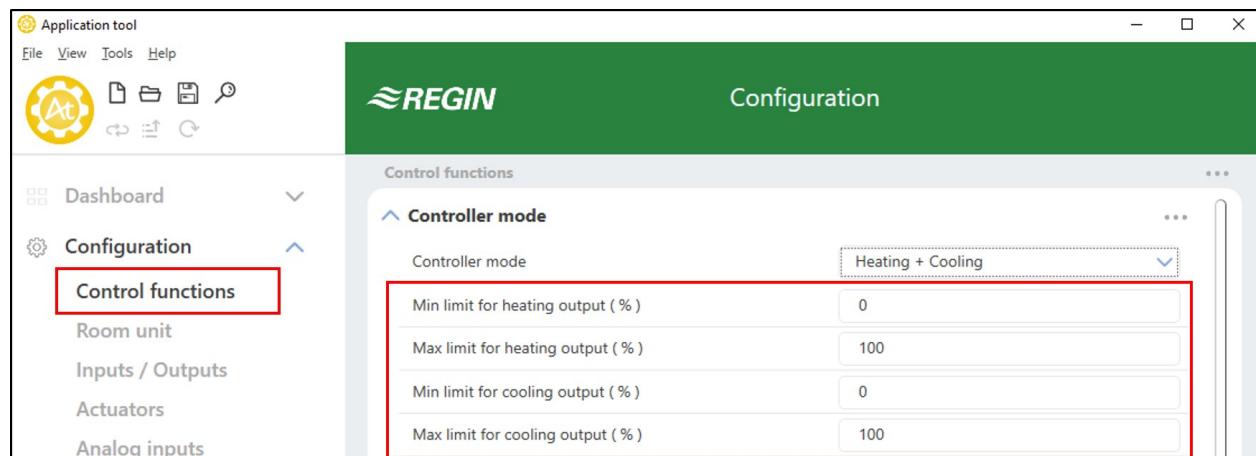

Figure 2-14 Configuration settings for maximum and minimum heating and cooling output limits in Application tool.

The heating output limits are active when the controller is in heating mode, and inactive when the controller is not in heating mode. When the controller is in heating mode or not is defined by the used controller mode, see section 2.1.

Figure 2-15 illustrates how the control behaviour is affected when limits are set for the heating output. For example, when a 85% maximum limit is set, *Heating signal* never exceeds 85% of its practical maximum (100%). When a 20% minimum limit is set, *Heating signal* is always at least 20%, as long as the controller is in heating mode.

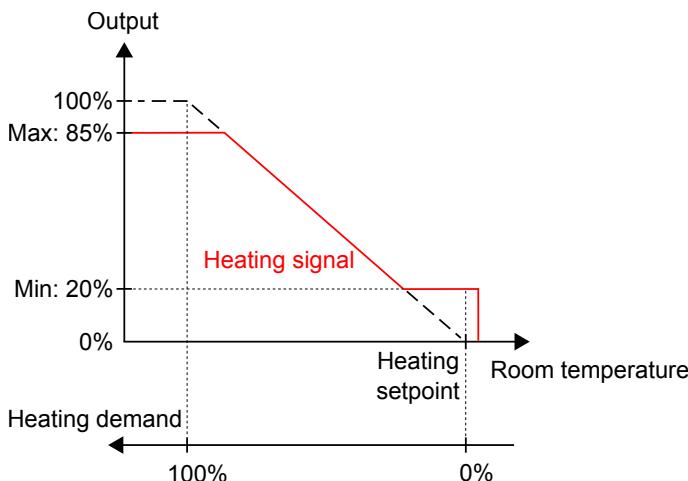

Figure 2-15 Control behaviour when maximum and minimum limits are set for the heating output.

The cooling output limits are active when the controller is in cooling mode, and inactive when the controller is not in cooling mode. When the controller is in cooling mode or not is defined by the used controller mode, see section 2.1.

Figure 2-16 illustrates how the control behaviour is affected when limits are set for the cooling output. For example, if a 85% maximum limit is set, *Cooling signal* never exceeds 85% of its practical maximum (100%). When a 20% minimum limit is set, *Cooling signal* is always at least 20%, as long as the controller is in cooling mode.

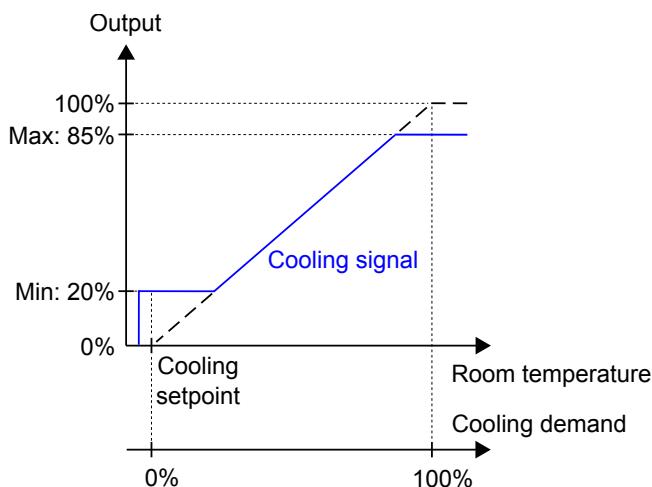

Figure 2-16 Control behaviour when maximum and minimum limits are set for the cooling output.

2.3 Change-over

Change-over is a control function that enables the controller to provide both a heating or a cooling signal on the same controller output. This is achieved by shifting the controller change-over state from *heating* to *cooling*, and vice versa. The change-over function makes it possible to use the controller in a 2-pipe change-over HVAC system, where warm or cold media flow in the same pipes and one valve is used to regulate both heating and cooling distribution.

The controller change-over state is either *heating* or *cooling*, and is managed automatically via change-over detection, see section 2.3.1. The controller change-over state can also be set manually via the Manual / Auto settings, or via communication.

Control functions

The change-over function is enabled and the configuration settings for change-over detection are shown in Application tool when one of the following controller modes is selected:

- ✓ Heating/Cooling (change-over)
- ✓ Heating + Heating/Cooling (change-over)

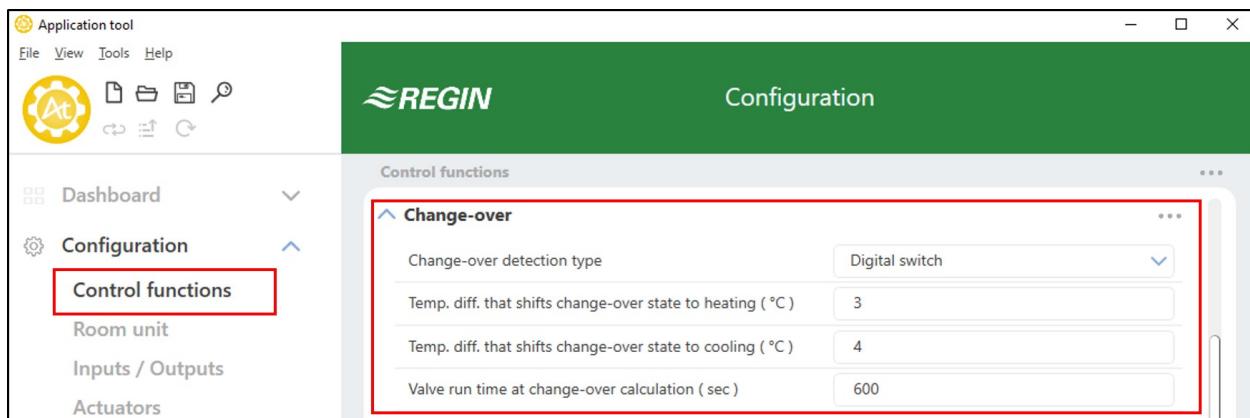

Figure 2-17 Change-over detection configuration settings in Application tool.

2.3.1 Change-over detection

Change-over detection is performed either by using a PT1000 sensor that is connected to an analog input, or by using a potential-free contact that is connected to a digital input. The PT1000 sensor is mounted so that it senses the pipe medium temperature.

When using a PT1000 sensor for change-over detection, the shift in controller change-over state is triggered based on the difference between the pipe medium temperature and the room temperature. The controller shifts the change-over state to *heating* when the pipe medium temperature is 3°C (default setting) higher than the room temperature. The controller shifts the change-over state to *cooling* when the pipe medium temperature is 4°C (default setting) lower than the room temperature.

When using a potential-free contact for change-over detection, the controller shifts the controller change-over state to *cooling* when the contact is closed. The controller shifts the controller change-over state to *heating* when the contact is open. This assumes that the digital input is set to **Normally opened**, see the *Configuration -> Inputs / Outputs* pane in Application tool.

Change-over detection is configured on the controller inputs by using the values listed in *Table 2-11*.

Table 2-11 Change-over detection configuration values and controller input types.

| Controller input configuration value | Controller input type |
|--------------------------------------|-----------------------|
| Change-over temperature | Analog |
| Change-over | Digital |

The configuration settings for change-over detection are described in *Table 2-12*.

Table 2-12 Change-over detection configuration settings.

| Configuration setting | Description |
|---|---|
| Change-over detection type | Digital switch: Must be selected if a digital input is used for change-over detection (default setting). Analog temperature in incoming pipe: Must be selected if an analog input is used for change-over detection. |
| Temp. diff. that shifts change-over state to heating (°C) | The controller shifts the change-over state to <i>heating</i> when the pipe medium temperature is this amount of degrees higher than the room temperature. |

Table 2-12 Change-over detection configuration settings. (continued)

| Configuration setting | Description |
|---|---|
| Temp. diff. that shifts change-over state to cooling (°C) | The controller shifts the change-over state to <i>cooling</i> when the pipe medium temperature is this amount of degrees lower than the room temperature. |
| Valve run time at change-over calculation (sec) | The period of time (in seconds) that the valve is open before the pipe medium temperature is measured and compared to the room temperature. |

2.4 Controller state

Controller state is a control function that makes it possible for the room HVAC system to operate with priority on comfort or energy saving.

The following controller states are available for use and the controller always operates in one of them:

- ✓ Off
- ✓ Unoccupied
- ✓ Standby
- ✓ Occupied
- ✓ Bypass

Figure 2-18 Controller state configuration settings in Application tool.

The different controller states make use of various setpoint and deadband settings to regulate the heating and cooling distribution, as described in section 2.4.1. See section 5 for information about setpoint and deadband settings, and setpoint adjustment.

The controller state configuration settings are described in section 2.4.2, and controller state changes are described in section 2.4.3.

An overview of the controller states is provided in *Table 2-13*.

Control functions

Table 2-13 Controller state overview.

| Controller state | Description | Priority | Indications in room units with display | LED indication in room units without display |
|------------------|--|------------------------------------|--|--|
| Off | This state is typically used for when the room is not in use for an extended period of time, for example, during holidays or long weekends. In this state, the controller only provides heating control for frost protection, which keeps the room temperature above 8 °C. | Energy saving and frost protection | ✓ OFF indication is shown. ✓ HEAT indication is shown when the demand is greater than zero. | ✓ Off |
| Unoccupied | This state is typically used for when the room is not in use for an extended period of time, for example, during holidays or long weekends. | Energy saving | ✓ OFF indication is shown. ✓ HEAT or COOL indication is shown when the demand is greater than zero. ✓ The room temperature, setpoint, setpoint adjustment, or CO ₂ level is shown (according to the current room unit configuration, see section 3.9.4). | ✓ Off |
| Standby | This state is typically used for when the room is not in use, temporarily or for shorter periods of time, such as during evenings, nights, or weekends. | Energy saving | ✓ STANDBY indication is shown. ✓ HEAT or COOL indication is shown when the demand is greater than zero. ✓ The room temperature, setpoint, setpoint adjustment, or CO ₂ level is shown (according to the current room unit configuration, see section 3.9.4). | ✓ Blinking |
| Occupied | This state is typically used for when the room is in use. | Comfort | ✓ Occupancy indication is shown. ✓ HEAT or COOL indication is shown when the demand is greater than zero. ✓ The room temperature, setpoint, setpoint adjustment, or CO ₂ level is shown (according to the current room unit configuration, see section 3.9.4). | ✓ Solid |
| Bypass | This state is typically used for when the room is in use, and when a temporary maximum flow of fresh air is needed. For example, when the room needs an extra boost of fresh air prior to a scheduled meeting that is going to fill up the room with a large amount of people, or due to high a CO ₂ level. The increase in airflow is achieved by using the forced ventilation function, see section 2.7. | Comfort and improved air quality | ✓ Occupancy indication is shown. ✓ HEAT or COOL indication is shown when the demand is greater than zero. ✓ Forced ventilation indication is shown when forced ventilation is active. ✓ The room temperature, setpoint, setpoint adjustment, or CO ₂ level is shown (according to the current room unit configuration, see section 3.9.4). | ✓ Blinking slowly |

2.4.1 Control behaviour

This section describes the control behaviour for the different controller states when the controller regulates based on heating and cooling demand.

Off

In this state, the controller does not regulate based on the configured occupied heating and cooling setpoints. Instead, the controller only provides heating control based on the configured frost protection setpoint. Setpoint adjustment is not active in this controller state.

Active setpoint: The configured frost protection setpoint.

Figure 2-19 illustrates the control behaviour when no maximum or minimum limits are set for the output signal.

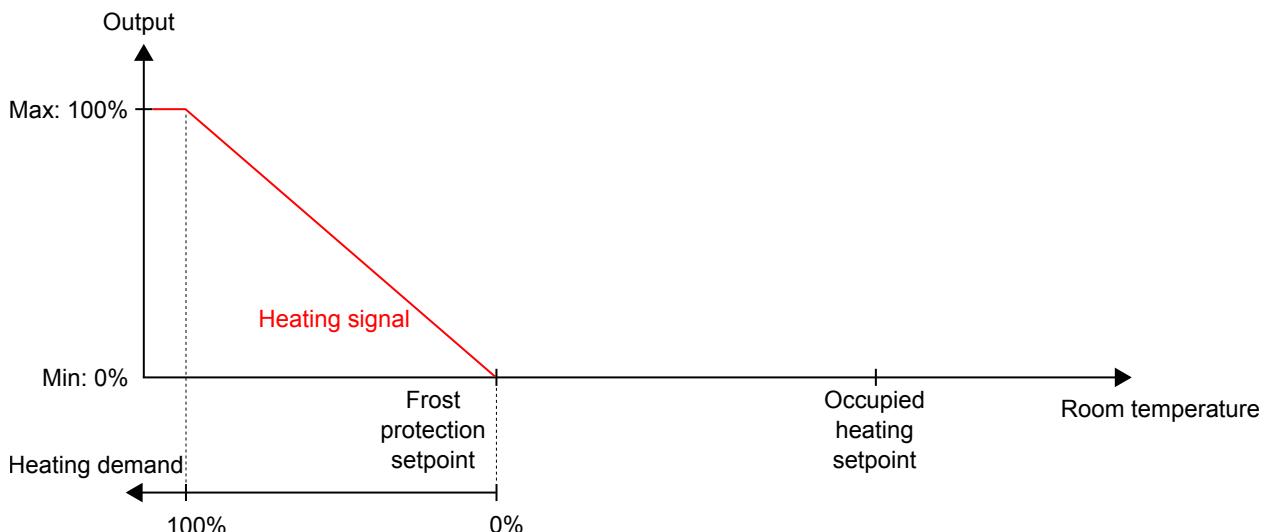

Figure 2-19 Control behaviour for the off controller state.

Unoccupied

In this state, the controller does not regulate based on the configured occupied heating and cooling setpoints. Instead, the controller provides heating and cooling control based on the configured unoccupied heating and cooling setpoints. Setpoint adjustment is not active in this controller state.

Active setpoints: The configured unoccupied heating and cooling setpoints.

Figure 2-20 illustrates the control behaviour when no maximum or minimum limits are set for the output signals.

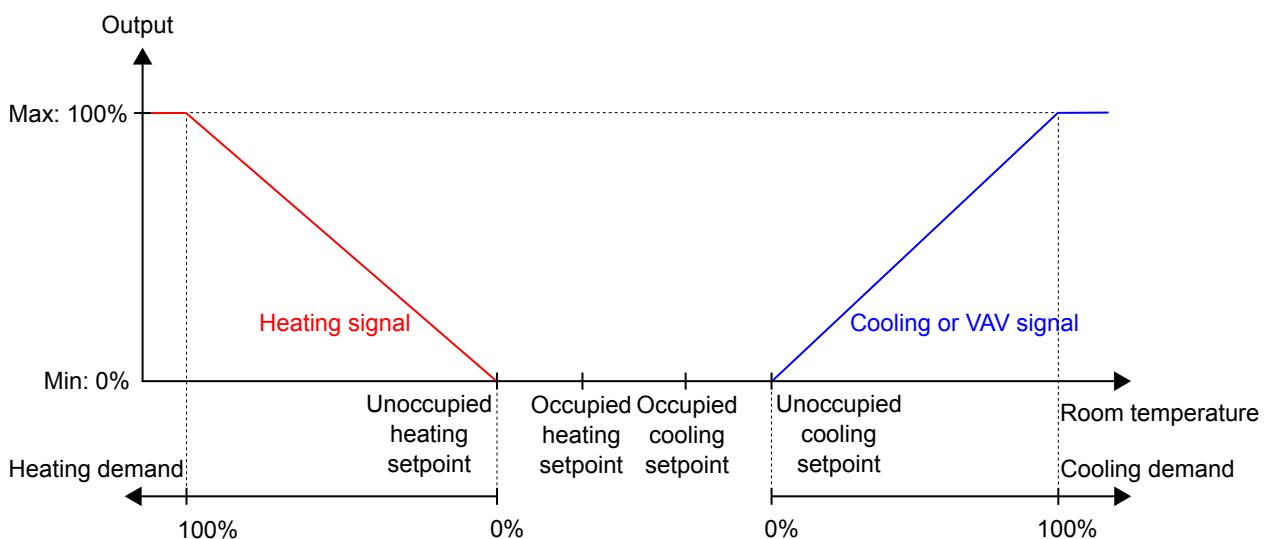

Figure 2-20 Control behaviour for the unoccupied controller state.

Standby

In this state, the controller regulates based on the configured occupied heating and cooling setpoints, in combination with the configured *standby deadband* setting. Setpoint adjustment is active in this controller state.

Active setpoints: The configured occupied heating and cooling setpoints, combined with the configured *standby deadband* setting and any applied setpoint adjustment.

Control functions

Figure 2-21 illustrates the control behaviour when no maximum or minimum limits are set for the output signals.

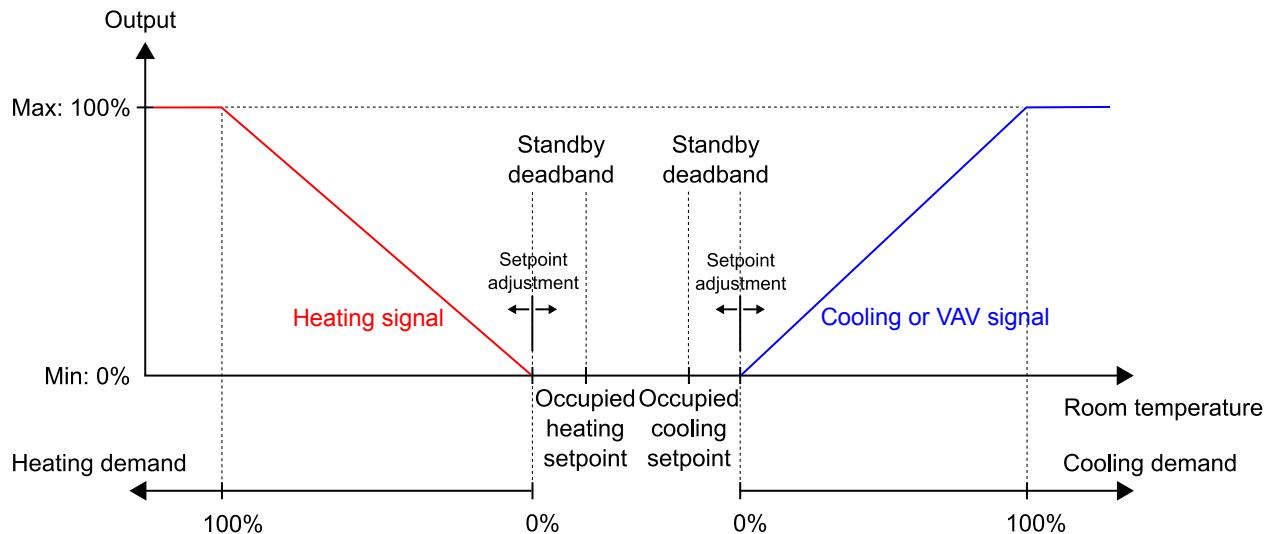

Figure 2-21 Control behaviour for the standby controller state.

Occupied and Bypass

In these states, the controller regulates based on the configured occupied heating and cooling setpoints. Setpoint adjustment is active in these controller states.

The forced ventilation function can be used when the controller changes to bypass state. See section 2.7 for information about the forced ventilation function.

Active setpoints: The configured occupied heating and cooling setpoints, combined with any applied setpoint adjustment.

Figure 2-22 illustrates the control behaviour when no maximum or minimum limits are set for the output signals.

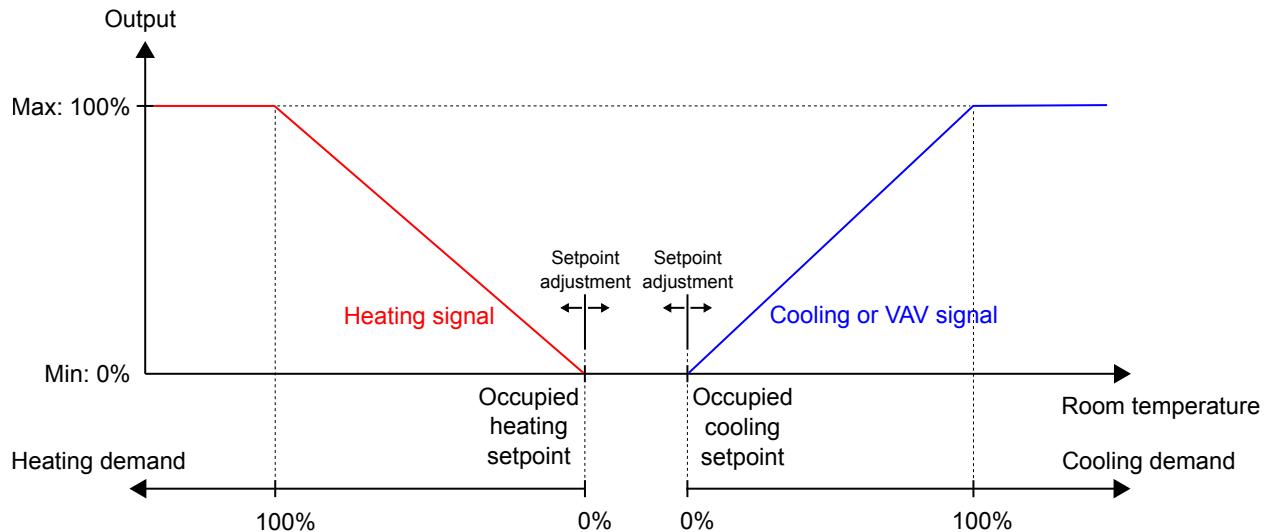

Figure 2-22 Control behaviour for the occupied and bypass controller state.

2.4.2 Configuration settings

The controller state configuration settings are described in *Table 2-14*.

Table 2-14 Controller state configuration settings.

| Configuration setting | Description |
|----------------------------|--|
| Preset controller state | One of the following controller states is configured as the preset controller state: ✓ Off ✓ Unoccupied ✓ Standby ✓ Occupied (default setting) |
| Shutdown controller state | One of the following controller states is configured as the shutdown controller state: ✓ Off ✓ Unoccupied (default setting) ✓ Standby ✓ Occupied |
| Time in bypass state (min) | The period of time (in minutes) that the controller is in bypass state before the controller changes state to the configured preset controller state. |

2.4.3 State changes

The controller changes state when one of the following events occur:

- ✓ The occupancy (on/off) button on the room unit is pressed shorter than 5 seconds (short press).
- ✓ The occupancy (on/off) button on the room unit is pressed for more than 5 seconds (long press).
- ✓ Presence is detected:
 - ✓ Via a presence detector, for example, a motion detector, which is connected to the controller.
 - ✓ Due to a high CO₂ level that is detected via a CO₂ sensor, which is connected to the controller.
- See section 2.8 for information about the presence detection function and presence detection configuration settings.
- ✓ The bypass state timeout expires.
- ✓ Presence is not detected anymore.
- ✓ A schedule (occupied or unoccupied) is activated or deactivated.
- ✓ A central command is issued via communication, for example, from a SCADA system.

The following sections provide flow charts that describe how the different events trigger controller state changes.

Occupancy (on/off) button on room unit

Figure 2-23 describes controller state changes for when the occupancy (on/off) button on the room unit is used.

Control functions

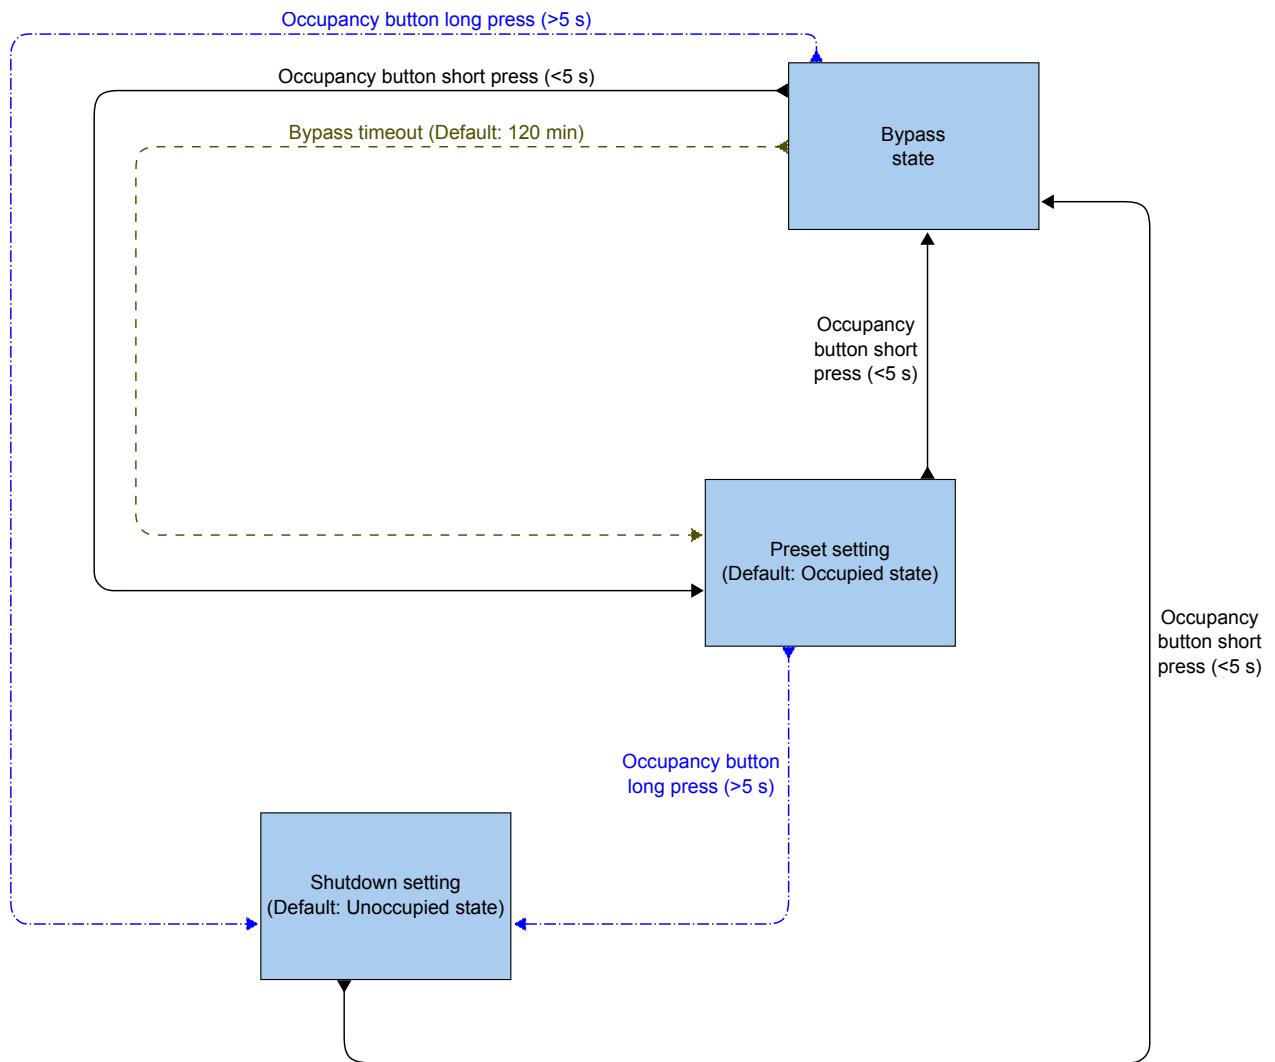

Figure 2-23 Flow chart describing controller state changes for when the occupancy (on/off) button on the room unit is used.

Presence detection and occupancy (on/off) button on room unit

Figure 2-24 describes controller state changes for when presence detection and the occupancy (on/off) button on the room unit are used.

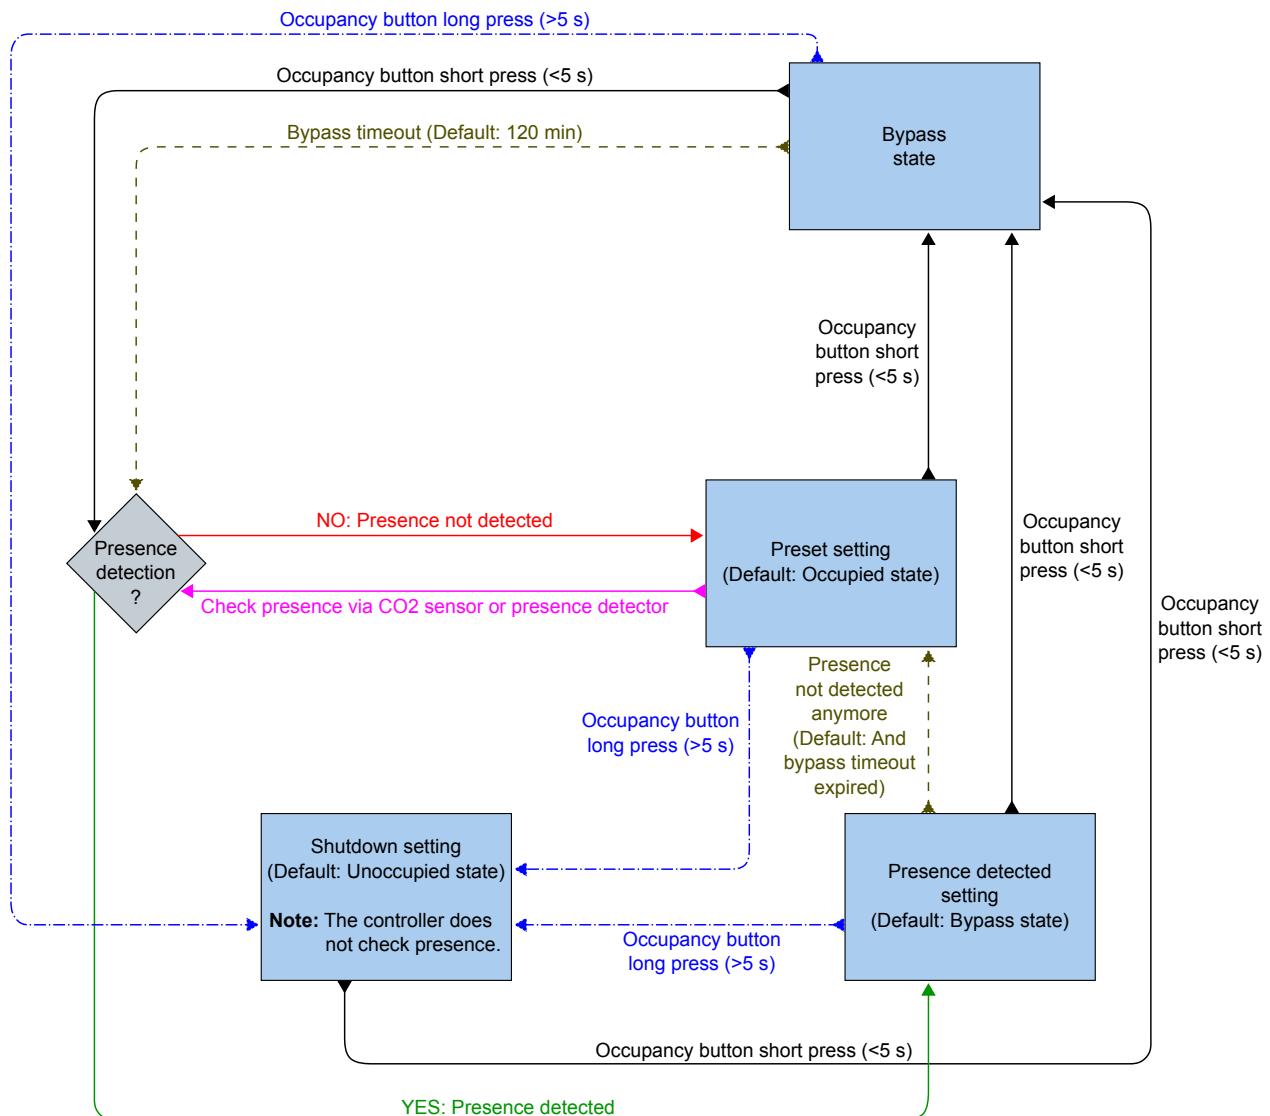

Figure 2-24 Flow chart describing controller state changes for when presence detection and the occupancy (on/off) button on the room unit are used.

Schedules and occupancy (on/off) button on room unit

Figure 2-25 describes controller state changes for when schedules and the occupancy (on/off) button on the room unit are used.

The occupied schedule has precedence. That is, if the occupied and unoccupied schedules are configured as active during the same period of time, the occupied schedule is active.

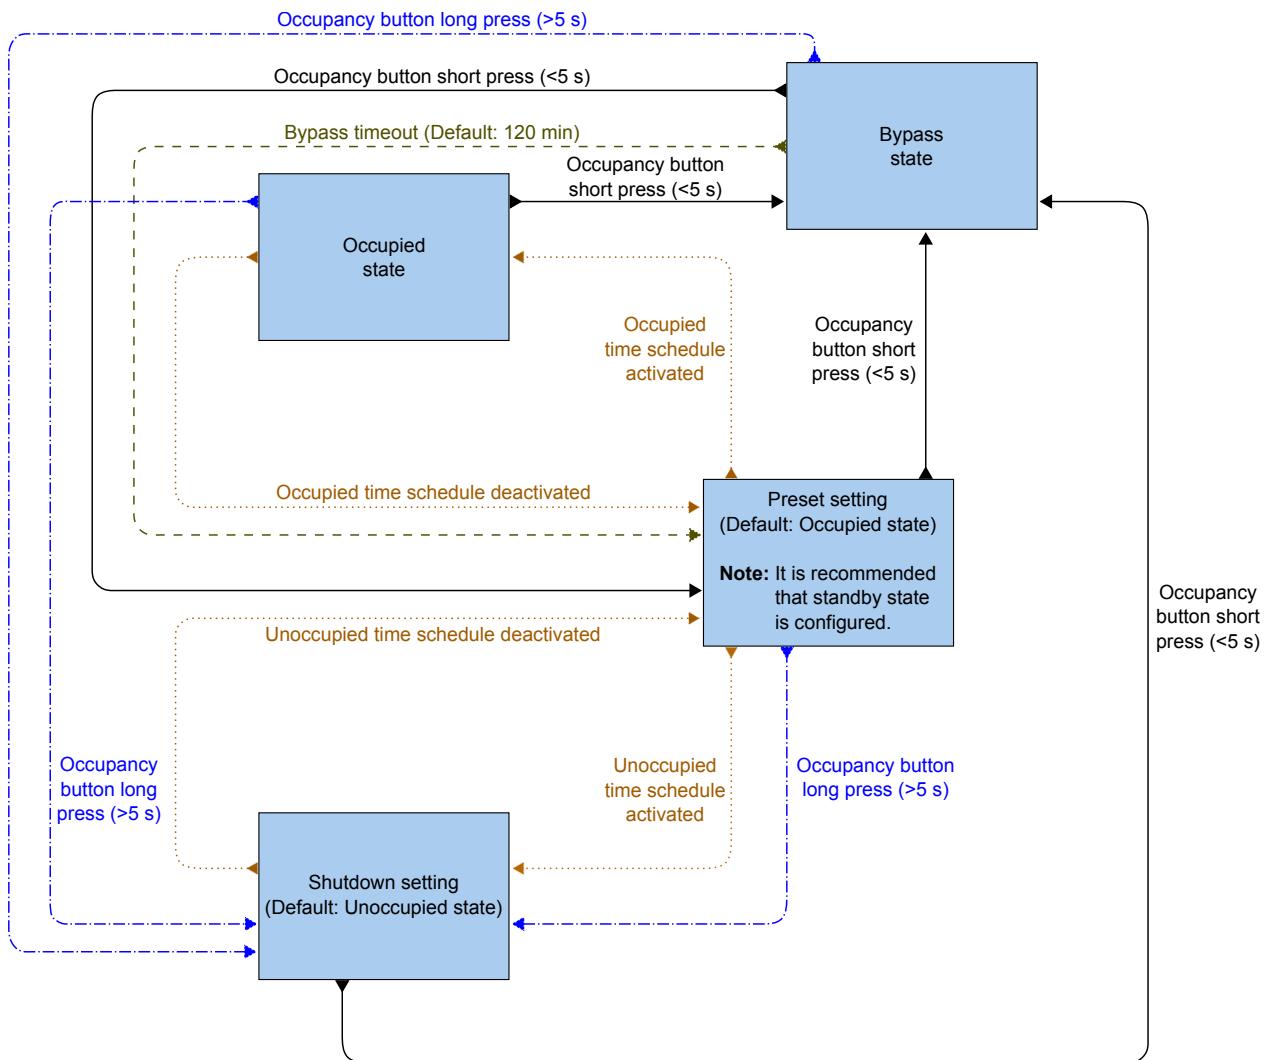

Figure 2-25 Flow chart describing controller state changes for when schedules and the occupancy (on/off) button on the room unit are used.

2.5 Fan control

The fan control function enables the controller to regulate the fan speed for EC fans or 3-speed fans.

A fan is controlled in auto or manual mode. In auto mode, the fan speed is determined by the current heating or cooling demand. In manual mode, one of the following speeds is used:

- ✓ Off
- ✓ Low speed: Fan speed 1
- ✓ Medium speed: Fan speed 2
- ✓ High speed: Fan speed 3

The operative fan mode that is currently in use, that is, auto or manual (off, low speed, medium speed, or high speed), is selected by the end user via the room unit, or set via communication. When the controller is in the state specified by the *Shutdown controller state* setting, see section 2.4.2, the operative fan mode is always auto.

In addition, fan control provides the following optional functions:

- ✓ Fan boost, see section 2.5.3.

- ✓ Fan kick-start see section 2.5.4.
- ✓ Fan afterblow see section 2.5.5.

2.5.1 EC fan control

The EC fan control function is enabled and the EC fan control configuration settings are shown in Application tool when the configuration value listed in *Table 2-15* is configured on a controller output.

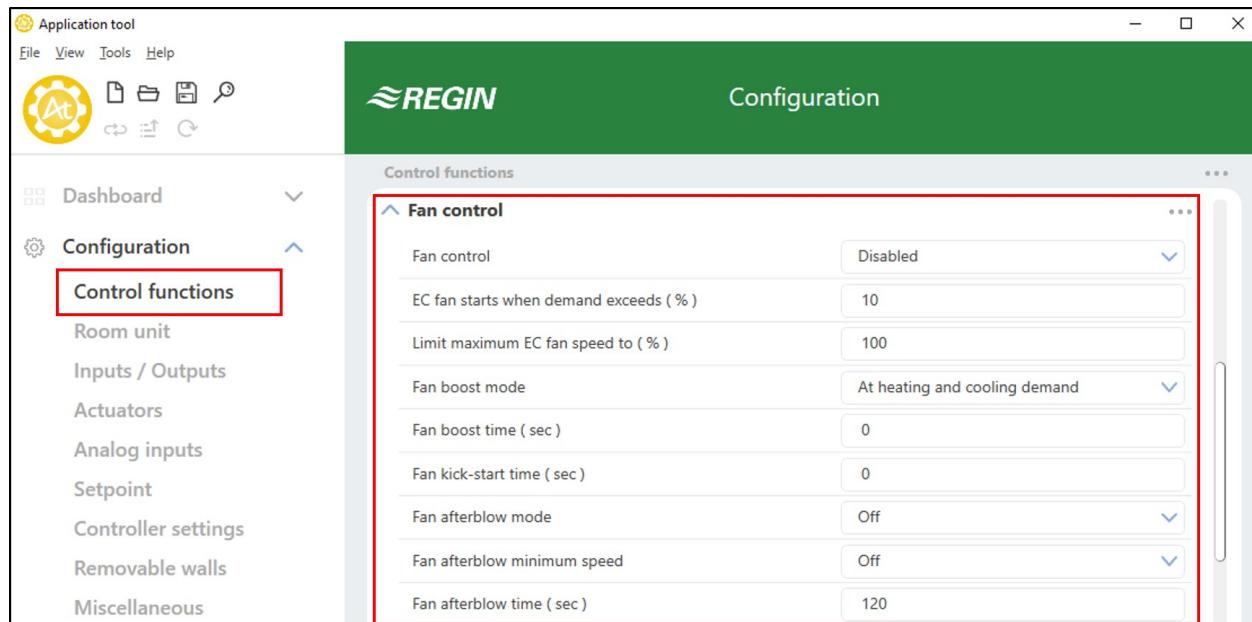

Figure 2-26 EC fan control configuration settings in Application tool.

The controller outputs a fan speed signal, Y1, that is configured on a controller output by using the value in *Table 2-15*.

In auto mode, the Y1 signal corresponds to the current heating or cooling demand, as illustrated in *Figure 2-27*.

In manual mode, the Y1 signal is independent of the current heating or cooling demand. Instead, the fan speed 1, 2, and 3 signals are defined by a number of equal thirds relative to the *Limit maximum EC fan speed to (%)* configuration setting, as illustrated in *Figure 2-28*. For example, the fan speed 1 signal is equal to 0.33 times the set maximum fan speed value, and the fan speed 2 signal is equal to 0.67 times the set maximum fan speed value.

Table 2-15 EC fan control configuration value and controller input type.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | EC fan | Analog |

The EC fan control configuration settings are described in *Table 2-16*.

Control functions

Table 2-16 EC fan control configuration settings.

| Configuration setting | Fan mode applicability | Description |
|---------------------------------------|------------------------|---|
| Fan control | Auto | Disabled: Fan control in auto mode is disabled (default setting). At cooling demand: Fan control in auto mode is active at cooling demand. At heating demand: Fan control in auto mode is active at heating demand. At heating and cooling demand: Fan control in auto mode is active both at heating and cooling demand. |
| Number of fan speeds | Auto and manual | None: Fan control in auto and manual mode is disabled. 1 speed: Only the fan speed 1 signal is used. In auto mode, this means that the controller outputs the fan speed 1 signal instead of the fan speed 2 and 3 signals. 2 speeds: Only the fan speed 1 and 2 signals are used. In auto mode, this means that the controller outputs the fan speed 2 signal instead of the fan speed 3 signal. 3 speeds: All 3 fan speed signals are used (default setting). |
| EC fan starts when demand exceeds (%) | Auto | The fan starts when this heating or cooling demand is exceeded. |
| Limit maximum EC fan speed to (%) | Auto and manual | In auto mode, the maximum fan speed is set by this value. In manual mode, the maximum fan speed is set by this value, and each fan speed is defined as: ✓ Fan speed 1 = 0.33 * this value ✓ Fan speed 2 = 0.67 * this value ✓ Fan speed 3 = 1 * this value |

Figure 2-27 illustrates the EC fan control behaviour in auto mode when a 90% maximum limit is set for the fan speed output signal, and a 10% heating and cooling demand threshold value for when the fan should start is set.

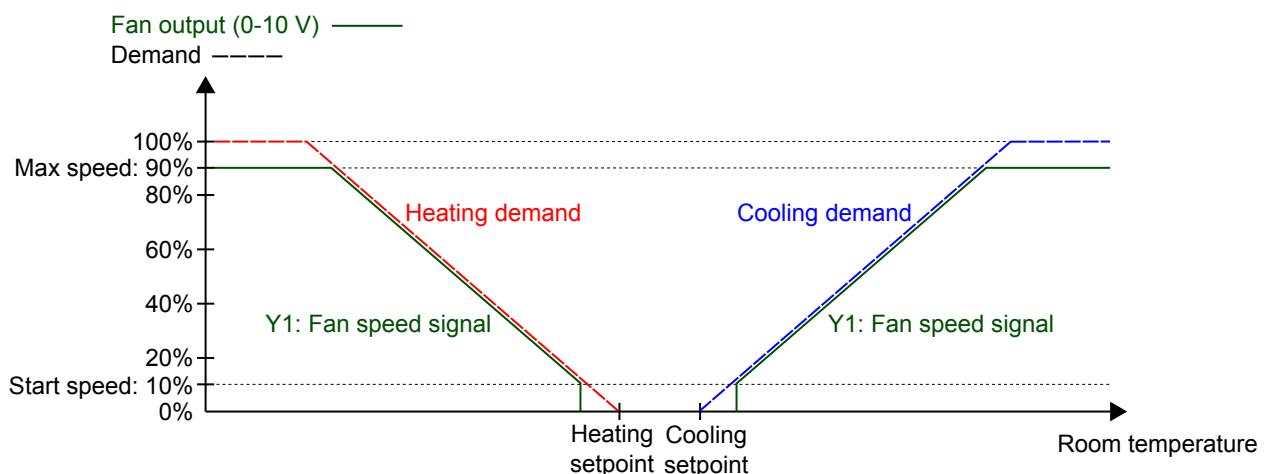

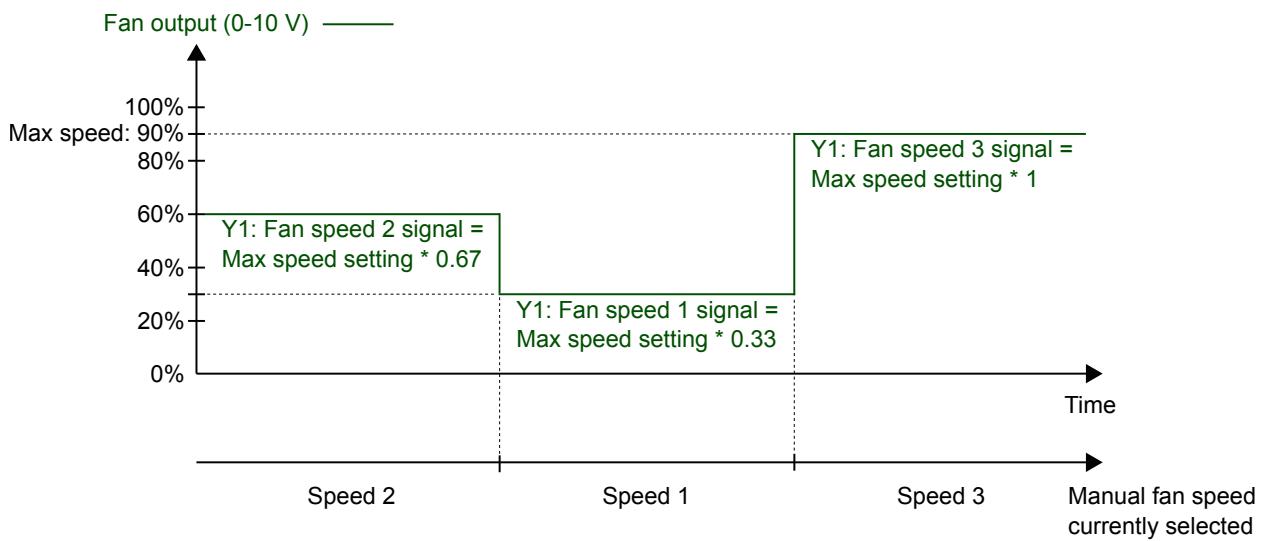

Figure 2-27 EC fan control behaviour in auto mode.

Figure 2-28 illustrates the EC fan control behaviour in manual mode when a 90% maximum limit is set for the fan speed output signal.

2.5.2 3-speed fan control

The 3-speed fan control function is enabled and the 3-speed fan control configuration settings are shown in Application tool when any of the configuration values listed in *Table 2-17* are configured on a controller output.

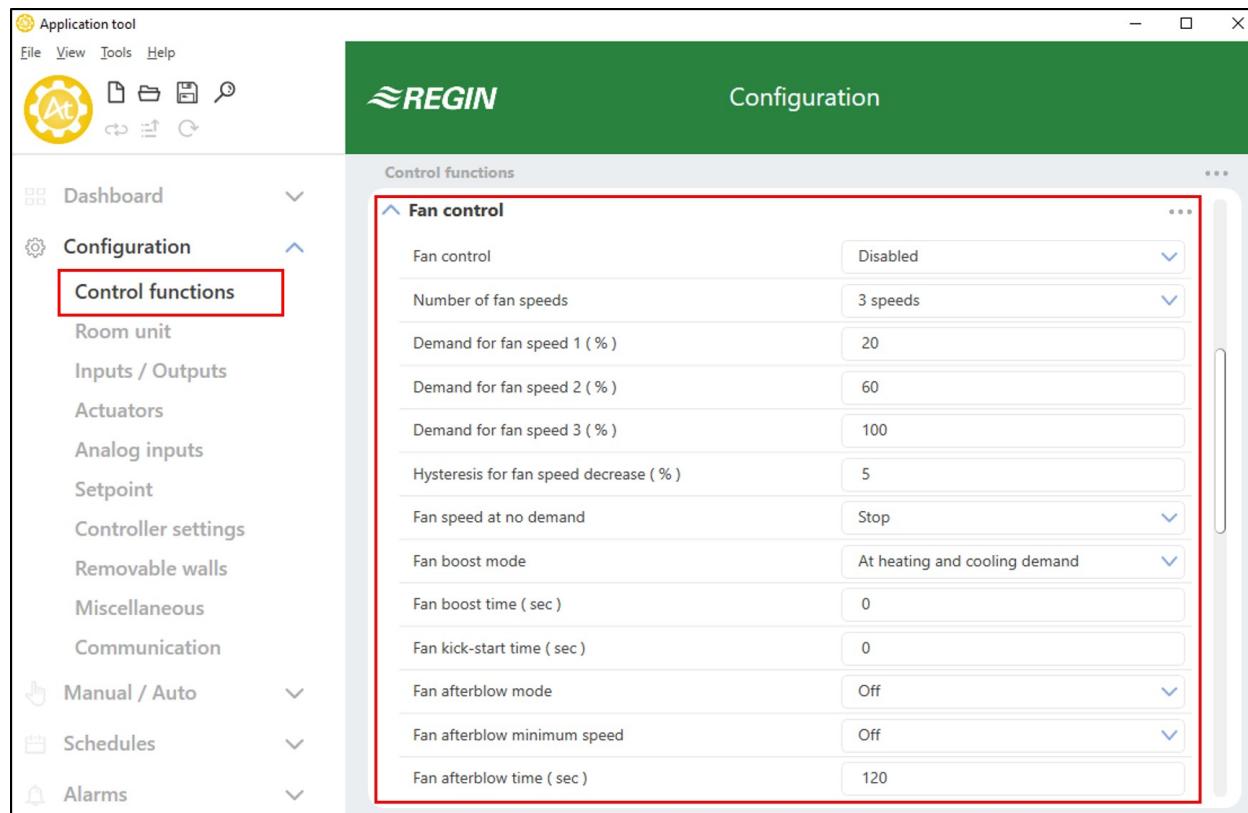

Figure 2-29 3-speed fan control configuration settings in Application tool.

The controller outputs 3 fan speed signals, Y1, Y2, and Y3, that are configured on the controller outputs by using the values listed in *Table 2-17*.

Control functions

In auto mode, the Y1, Y2, or Y3 signal is active when the current heating or cooling demand is higher than the corresponding *Demand for fan speed [nr] (%)* configuration setting, as illustrated in *Figure 2-30*.

In manual mode, the Y1, Y2, and Y3 signals are independent of the current heating or cooling demand. Instead, each fan speed signal is active when the corresponding fan speed is selected in the room unit or set via communication, as illustrated in *Figure 2-31*.

Table 2-17 3-speed fan control configuration values and controller output types.

| Output signal | Controller output configuration value | Controller output type |
|---------------|---------------------------------------|------------------------|
| Y1 | Fan speed 1 | Digital |
| Y2 | Fan speed 2 | Digital |
| Y3 | Fan speed 3 | Digital |

Table 2-18 3-speed fan control configuration settings.

| Configuration setting | Fan mode applicability | Description |
|---------------------------------------|------------------------|---|
| Fan control | Auto | Disabled: Fan control in auto mode is disabled (default setting). At cooling demand: Fan control in auto mode is active at cooling demand. At heating demand: Fan control in auto mode is active at heating demand. At heating and cooling demand: Fan control in auto mode is active at both heating and cooling demand. |
| Number of fan speeds | Auto and manual | None: Fan control in auto and manual mode is disabled. 1 speed: Only the fan speed 1 signal is used. In auto mode, this means that the controller outputs the fan speed 1 signal instead of the fan speed 2 and 3 signals. 2 speeds: Only the fan speed 1 and 2 signals are used. In auto mode, this means that the controller outputs the fan speed 2 signal instead of the fan speed 3 signal. 3 speeds: All 3 fan speed signals are used (default setting). |
| Demand for fan speed 1 (%) | Auto | The fan speed 1 signal is active when the current heating or cooling demand is higher than this value and lower than the value set by the <i>Demand for fan speed 2 (%)</i> setting. |
| Demand for fan speed 2 (%) | Auto | The fan speed 2 signal is active when the current heating or cooling demand is higher than this value and lower than the value set by the <i>Demand for fan speed 3 (%)</i> setting. |
| Demand for fan speed 3 (%) | Auto | The fan speed 3 signal is active when the current heating or cooling demand is higher than this value. |
| Hysteresis for fan speed decrease (%) | Auto | Specifies the hysteresis for when a decrease in fan speed occurs. For example, if the <i>Demand for fan speed 2 (%)</i> setting is 60% and this setting is 5%, the fan speed 2 signal is deactivated when the heating or cooling demand decrease below $60 - 5 = 55\%$. At the same time, the fan speed 1 signal is activated. |
| Fan speed at no demand | Auto | Stop: The fan speed 1 signal is inactive when the heating or cooling demand is lower than the value specified by the <i>Demand for fan speed 1 (%)</i> setting (default setting). Fan speed 1: The fan speed 1 signal is active also when the heating or cooling demand is lower than the value specified by the <i>Demand for fan speed 1 (%)</i> setting. |

Figure 2-30 illustrates the 3-speed fan control behaviour in auto mode when no hysteresis for fan speed decrease is applied, the fan speed 1, 2, and 3 signals are configured on digital outputs 3, 4, and 5, and the *Demand for fan speed [nr] (%)* settings are set to 20, 60, and 100, respectively.

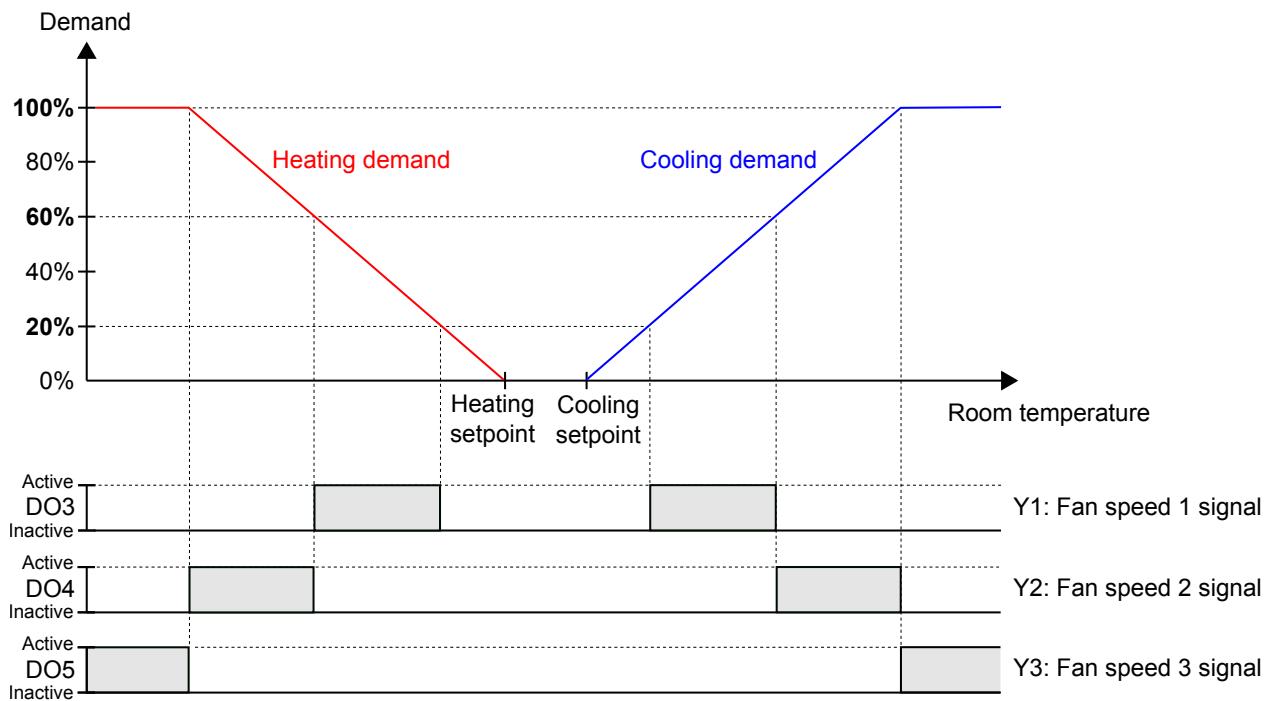

Figure 2-30 3-speed fan control behaviour in auto mode.

Figure 2-31 illustrates the 3-speed fan control behaviour in manual mode when the fan speed 1, 2, and 3 signals are configured on digital outputs 3, 4, and 5.

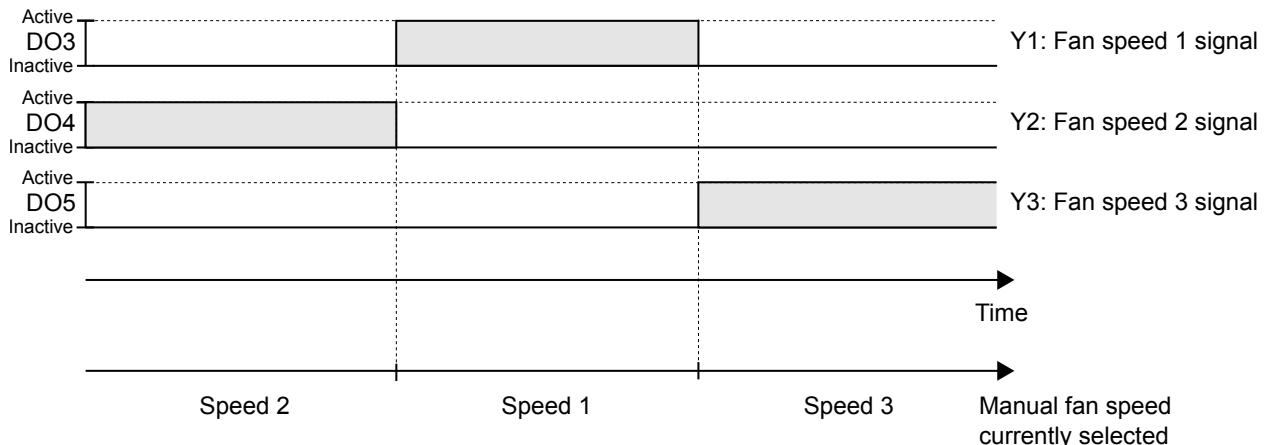

Figure 2-31 3-speed fan control behaviour in manual mode (fan speed 1, 2, or 3).

2.5.3 Fan boost

Fan boost is a control function that can be used to acknowledge to the person in the room that the fan is started when the occupancy (on/off) button in the room unit is pressed, or when the controller detects presence. This is useful when the initial heating or cooling demand is low (the difference between the room temperature and setpoint is small), since the fan then typically runs at a low speed.

Another use case for the fan boost function is to temporarily run the fan at an increased speed to provide a perceived cooling effect, until the cooling distribution from the cooling valve establishes.

The fan boost is achieved by the use of a separate fan boost controller that operates in parallel with the temperature controller, and temporarily increases the fan speed for a configured period of time (the fan boost time). P-band and I-time settings for the different controllers are located in the *Configuration -> Controller settings* pane in Application tool.

Control functions

The fan boost function is enabled by configuring the *Fan boost time* setting to a value that is greater than zero.

The fan boost function is activated when presence is detected, see section 2.8, or when the controller changes to bypass state, see section 2.4. The fan boost time is independent of the *Time in bypass state* configuration setting.

When the fan boost function is active, the fan runs at maximum speed for the first 10 seconds of the fan boost time. For the remainder of the fan boost time, the fan speed output signal corresponds to whichever of the fan boost or temperature control signal that has the greatest value.

After the fan boost time has expired, the fan speed output signal corresponds to the temperature control signal, regardless if the fan boost control signal is greater than the temperature control signal. That is, the controller reverts to normal fan control, which is either auto or manual mode.

The fan boost configuration settings are described in *Table 2-19*.

Table 2-19 Fan boost configuration settings.

| Configuration setting | Description |
|-----------------------|---|
| Fan boost mode | At cooling demand: Fan boost is active at cooling demand. At heating demand: Fan boost is active at heating demand. At heating and cooling demand: Fan boost is active at both heating and cooling demand (default setting). |
| Fan boost time (sec) | The period of time (in seconds) that the fan boost function is active. |

Figure 2-32 illustrates how the fan boost function can be used to provide a perceived cooling effect until the cooling distribution from the cooling valve establishes.

In this example, the control behaviour for an EC fan in auto mode is described. It is assumed that the room temperature is 28 °C and the cooling setpoint is 24 °C at 0 seconds, resulting in an error value of 4, and that the error value is reduced to 0 at 300 seconds. The fan boost time is set to 90 seconds. The P-band for the fan boost controller is set to 5 °C, and the P-band and I-time for the temperature controller is set to 10 °C and 300 seconds, respectively.

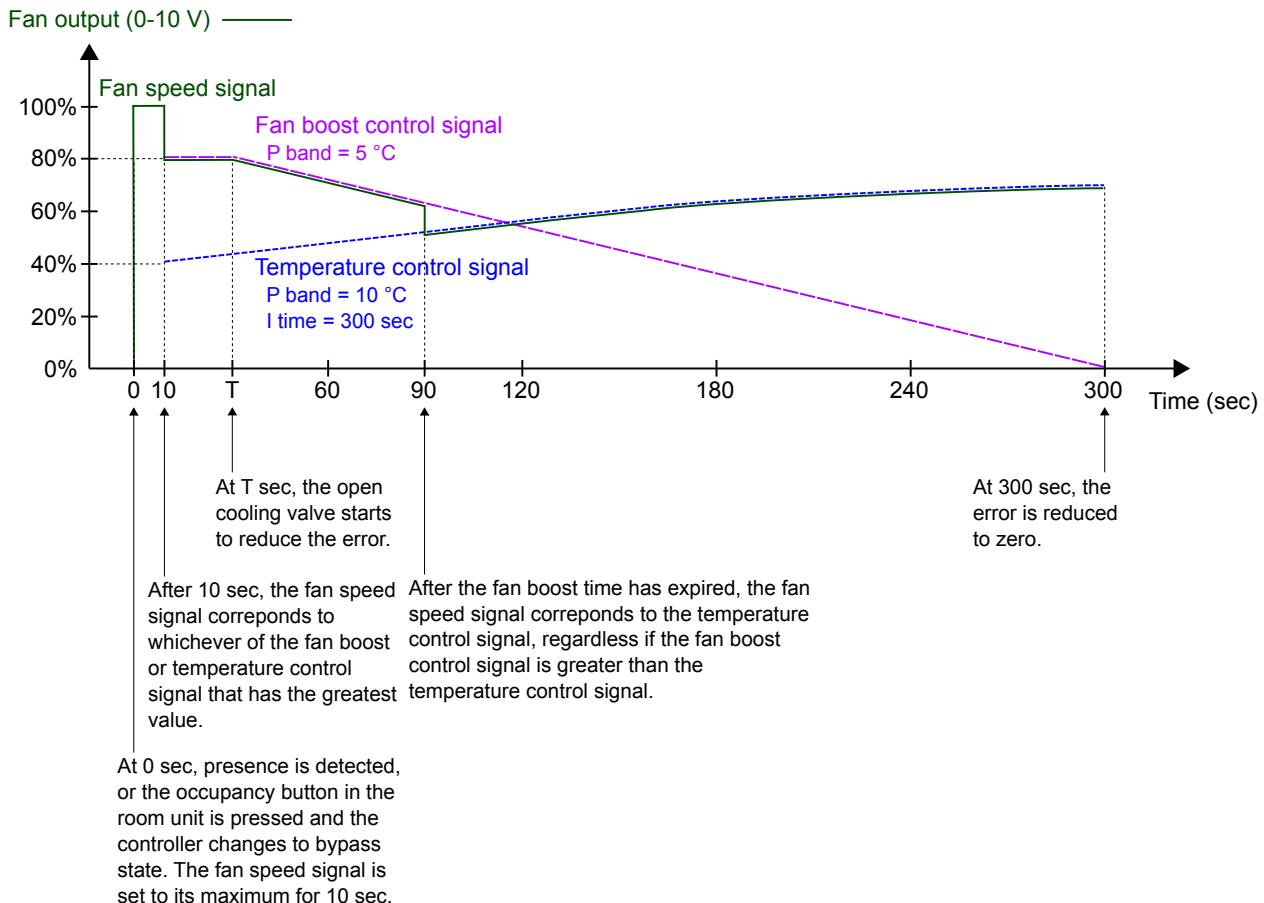

Figure 2-32 An example of fan boost control behaviour for an EC fan in auto mode, which provides a perceived cooling effect until the cooling distribution from the cooling valve establishes. The P-band for the fan boost controller has a lower value (higher gain) than the P-band for the temperature controller.

2.5.4 Fan kick-start

Fan kick-start is a control function that can be used to ensure that the EC fan starts even when the controller outputs a low-voltage control signal.

When using today's energy-saving EC fans, there is always a risk that the fan does not start due to a too low control voltage that prevents the fan from exceeding its starting torque. The fan then remains at a standstill while power still flows through it, which may cause damage to the fan. The fan kick-start function ensures that the fan output is at its maximum for a set period of time, thereby making sure that the starting torque is exceeded.

The fan kick-start function is enabled by configuring the *Fan kick-start time* setting to a value that is greater than zero.

The fan kick-start function is activated when the fan starts from standstill, in manual or auto mode.

When the fan kick-start function is active, the controller sets the fan speed output signal to its maximum for the period of time specified by the *Fan kick-start time* configuration setting.

After the fan kick-start time has expired, the controller reverts to normal fan control, that is, auto or manual mode.

The fan kick-start configuration settings are described in *Table 2-20*.

Control functions

Table 2-20 Fan kick-start configuration settings.

| Configuration setting | Description |
|---------------------------|---|
| Fan kick-start time (sec) | The period of time (in seconds) that the fan kick-start function is active. |

2.5.5 Fan afterblow

Fan afterblow is a control function that can be used as a safety precaution when an electrical heating battery that is placed in the ductwork is used to provide heating. For example, when auto fan mode is in use and the heating demand decreases to zero, the fan stops while the electrical heating battery typically remains hot for a while longer. The fan afterblow function can then be used to make the fan run for an extended period of time to allow for the electrical heating battery to cool off.

The fan afterblow function is enabled via the *Fan afterblow mode* configuration setting.

The fan afterblow function is activated when the applicable heating output signal, as specified via the *Fan afterblow mode* configuration setting, decreases to zero.

When the fan afterblow function is active, the fan runs in afterblow mode for the period of time specified by the *Fan afterblow time* configuration setting. A minimum fan speed during fan afterblow can be set via the *Fan afterblow minimum speed* configuration setting.

After the fan afterblow time has expired, the controller reverts to normal fan control, that is, auto or manual mode.

The fan afterblow configuration settings are described in *Table 2-21*.

Table 2-21 Fan afterblow configuration settings.

| Configuration setting | Description |
|-----------------------------|---|
| Fan afterblow mode | Off: Fan afterblow is disabled (default setting). After heating 1: Fan afterblow is activated when the heating output signal that is associated with heating sequence Y1 decreases to zero. After heating 2: Fan afterblow is activated when the heating output signal that is associated with heating sequence Y2 decreases to zero. After heating 1/2: Fan afterblow is activated both when the heating output signal that is associated with heating sequence Y1 or heating sequence Y2 decrease to zero. |
| Fan afterblow minimum speed | This setting is used to set a minimum fan speed during fan afterblow. Off: The minimum allowed fan speed is zero (default setting). Speed 1: The controller ensures that the minimum fan speed is the configured fan speed 1. Speed 2: The controller ensures that the minimum fan speed is the configured fan speed 2. Speed 3: The controller ensures that the minimum fan speed is the configured fan speed 3. |
| Fan afterblow time (sec) | The period of time (in seconds) that the fan afterblow function is active. |

2.6 VAV control

The variable air volume (VAV) control function is used to manage the behaviour for a damper that is controlled by the analog VAV output signal.

The VAV control function enables the controller to regulate based on:

✓ **Cooling demand**

The VAV output signal is controlled based on the cooling setpoint and the current room temperature.

✓ **Fresh air demand**

The VAV output signal is controlled based on the CO₂ setpoint and the current CO₂ level in the room.

✓ Both cooling and fresh air demand simultaneously

The highest demand determines if the VAV output signal currently is controlled based on the cooling setpoint and the room temperature, or the CO₂ setpoint and the CO₂ level in the room.

For information about CO₂ control, see section 2.10.

The maximum damper airflow can be controlled by setting a maximum limit on the VAV output signal. The minimum airflow that applies for each controller state can also be controlled by setting minimum limits on the VAV output signal.

The damper can also be controlled based on heating demand. This is useful when the heating device that provides the room with heat is located in the supply air duct and behind the damper that regulates the airflow into the room. When this function is active and the heating demand increases, the damper opens correspondingly and the distribution of heat into the room is boosted. This function is active when the *Max limit for VAV output at heating demand* configuration setting is greater than zero.

The VAV control function is enabled and the VAV control configuration settings in Application tool are shown when one of the following controller modes is selected:

- ✓ Heating + VAV
- ✓ Cooling + VAV
- ✓ VAV
- ✓ Heating + Cooling + VAV

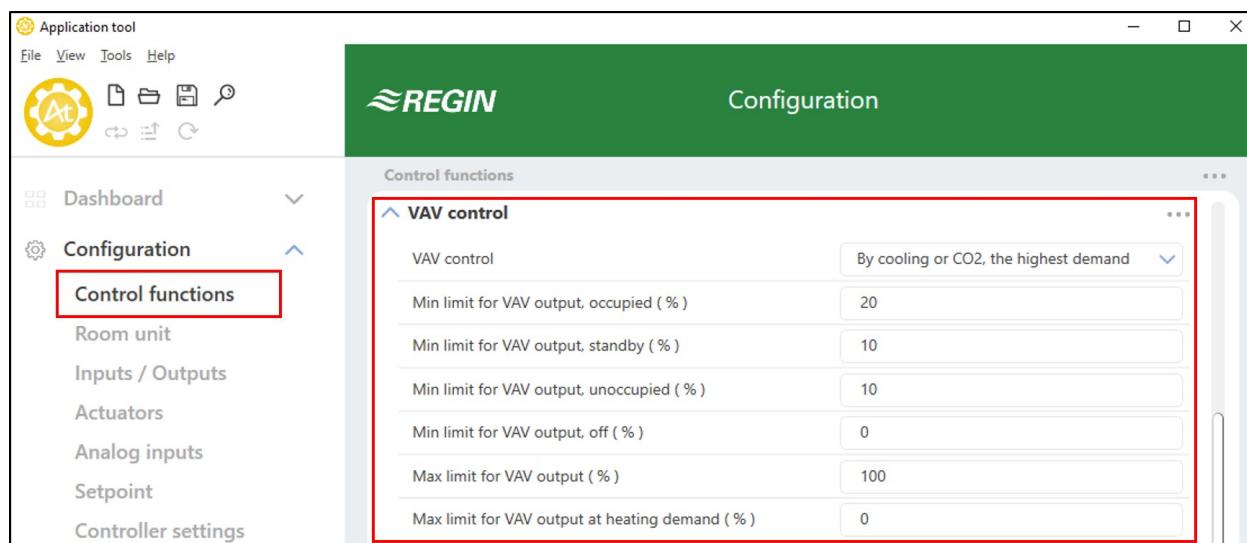

Figure 2-33 VAV control configuration settings in Application tool.

The VAV control configuration settings are described in *Table 2-22*.

Control functions

Table 2-22 VAV control configuration settings.

| Configuration setting | Description |
|--|---|
| VAV control | <p>By cooling demand: VAV control is performed based on cooling demand. The VAV output signal is controlled based on the cooling setpoint and the current room temperature.</p> <p>By CO₂ demand: VAV control is performed based on fresh air demand. The VAV output signal is controlled based on the CO₂ setpoint and the current CO₂ level in the room.</p> <p>By cooling or CO₂, the highest demand: VAV control is performed based on both cooling and fresh air demand simultaneously. The highest demand determines if the VAV output signal currently is controlled based on the cooling setpoint and the room temperature, or the CO₂ setpoint and the CO₂ level in the room (default setting).</p> |
| Min limit for VAV output, occupied (%) | Specifies the minimum limit for the VAV output signal when the controller is in the occupied controller state. |
| Min limit for VAV output, standby (%) | Specifies the minimum limit for the VAV output signal when the controller is in the standby controller state. |
| Min limit for VAV output, unoccupied (%) | Specifies the minimum limit for the VAV output signal when the controller is in the unoccupied controller state. |
| Min limit for VAV output, off (%) | Specifies the minimum limit for the VAV output signal when the controller is in the off controller state. |
| Max limit for VAV output (%) | Specifies the maximum limit for the VAV output signal. |
| Max limit for VAV output at heating demand (%) | <p>This setting is only applicable for the following controller modes:</p> <ul style="list-style-type: none"> ✓ Heating + VAV ✓ Heating + Cooling + VAV <p>When this value is greater than zero, the VAV output signal follows the heating output signal to a maximum that is specified by this value.</p> |

Figure 2-34 illustrates the control behaviour for the Heating + VAV controller mode when VAV control is performed based on cooling demand, a maximum limit is set, and minimum limits for the occupied and unoccupied controller states are set.

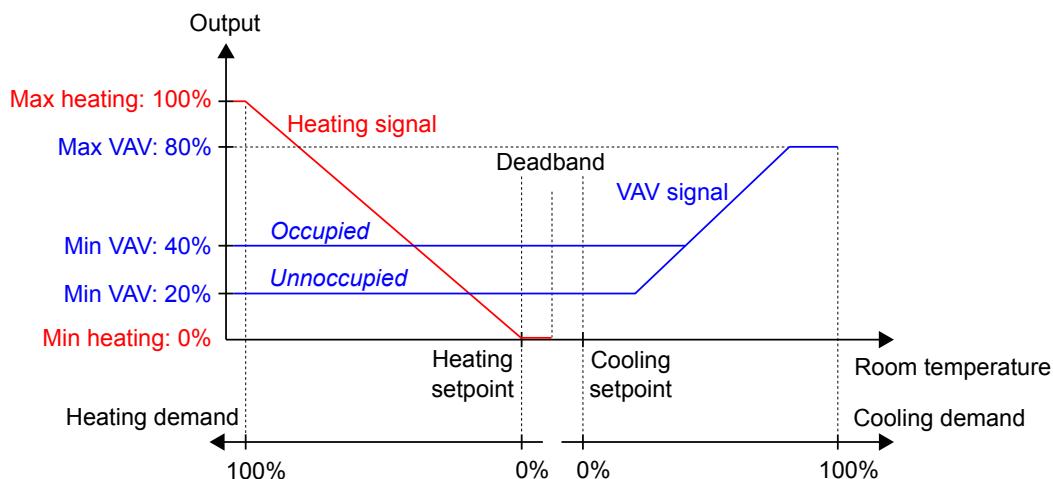

Figure 2-34 VAV control behaviour based on cooling demand when a maximum limit is set, and minimum limits for the occupied and unoccupied controller states are set.

Figure 2-35 illustrates the control behaviour for the Heating + VAV controller mode when the *Max limit for VAV output at heating demand* setting is applied. For example, when a 50% maximum is set, the VAV signal follows the heating signal as the heating demand increases but never exceeds 50% of its practical maximum (100%).

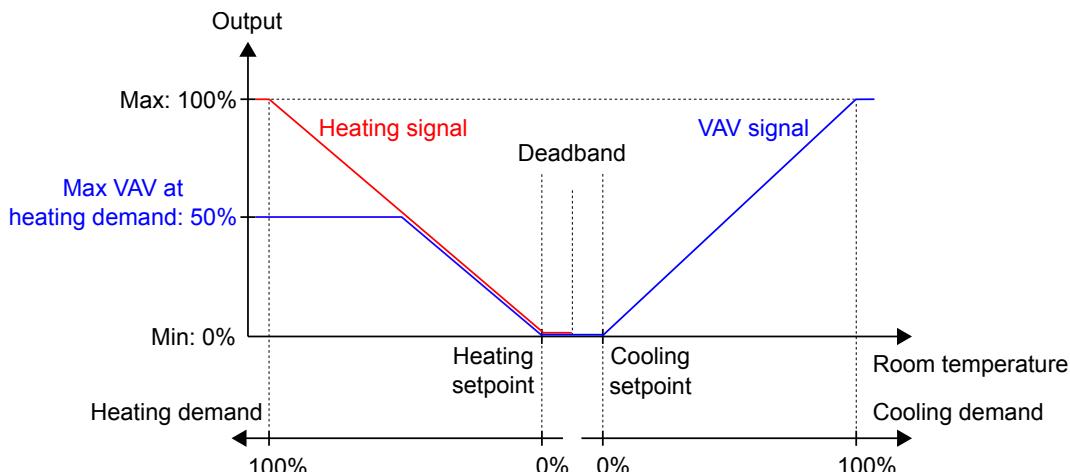

Figure 2-35 Control behaviour for the Heating + VAV controller mode when the maximum VAV output on heating demand setting is applied.

2.7 Forced ventilation

Forced ventilation is a control function that is used to improve the air quality in a room through increased airflow. This is achieved by fully opening the damper that regulates the airflow into the room, which provides an additional amount of fresh air and decreases the CO₂ level. The forced ventilation function can also be used to boost the heating or cooling distribution when the heating, cooling, or VAV output signal has reached its maximum.

The forced ventilation function can be used in all controller modes, and is enabled by applying the *Forced ventilation active* or *Forced ventilation active at max output* configuration settings, that is, changing them from their Off values.

The forced ventilation function is activated when the controller changes to bypass state and any of the conditions specified by the *Forced ventilation active* or *Forced ventilation active at max output* settings are fulfilled. See section 2.4 for information about bypass state.

When the forced ventilation function is active, a digital controller output that is configured with the **Forced ventilation** value is active, and the analog VAV output signal is set to its maximum for the controller modes that include a VAV sequence. Optionally, for the Cooling + VAV and Heating + Cooling + VAV controller modes, the cooling output signal can be configured to also be set to its maximum when the forced ventilation is active.

The forced ventilation configuration settings in Application tool are shown in *Figure 2-36*.

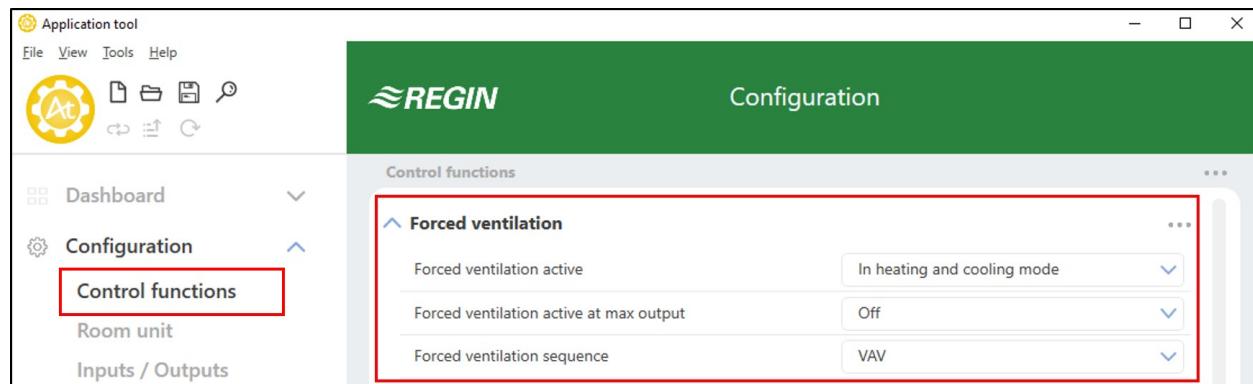

Figure 2-36 Forced ventilation configuration settings in Application tool.

Control functions

The forced ventilation configuration settings are described in *Table 2-23*.

Table 2-23 Forced ventilation configuration settings.

| Configuration setting | Description |
|---|---|
| Forced ventilation active | This setting is used to select if forced ventilation should be activated when the controller is in heating or cooling mode, or in both modes. This is useful for providing an additional amount of fresh air into the room and for decreasing the CO ₂ level. Off: Forced ventilation is not activated (default setting). In heating mode: Forced ventilation is activated when the controller is in heating mode and bypass state. In cooling mode: Forced ventilation is activated when the controller is in cooling mode and bypass state. In heating and cooling mode: Forced ventilation is activated both when the controller is in either heating or cooling mode, and in bypass state. |
| Forced ventilation active at max output | This setting is used to select if forced ventilation should be activated when the output signal is at its maximum. This is useful for providing a boosted heating or cooling effect when the heating, cooling, or VAV output signal have reached their maximum. Off: Forced ventilation is not activated (default setting). At max heating output: Forced ventilation is activated when the heating output signal is at its maximum and the controller is in bypass state. At max cooling/VAV output: Forced ventilation is activated when the cooling or VAV output signal is at its maximum and the controller is in bypass state. At max heating and cooling/VAV output: Forced ventilation is activated when the heating, cooling, or VAV output signal is at its maximum, and the controller is in bypass state. |
| Forced ventilation sequence | This setting is only applicable for the following controller modes: ✓ Cooling + VAV ✓ Heating + Cooling + VAV VAV: The VAV output signal is set to its maximum when the forced ventilation function is active (default setting). Cooling and VAV: Both the cooling and VAV output signals are set to their maximum when the forced ventilation function is active. |

Figure 2-37 illustrates the analog VAV output and digital output signal behaviour for the Heating + VAV controller mode when no maximum or minimum limits are set for the output signals, the controller is in bypass state, and the following configuration settings are applied:

- ✓ *Forced ventilation active:* Off
- ✓ *Forced ventilation active at max output:* At max heating output
- ✓ *Forced ventilation sequence:* VAV

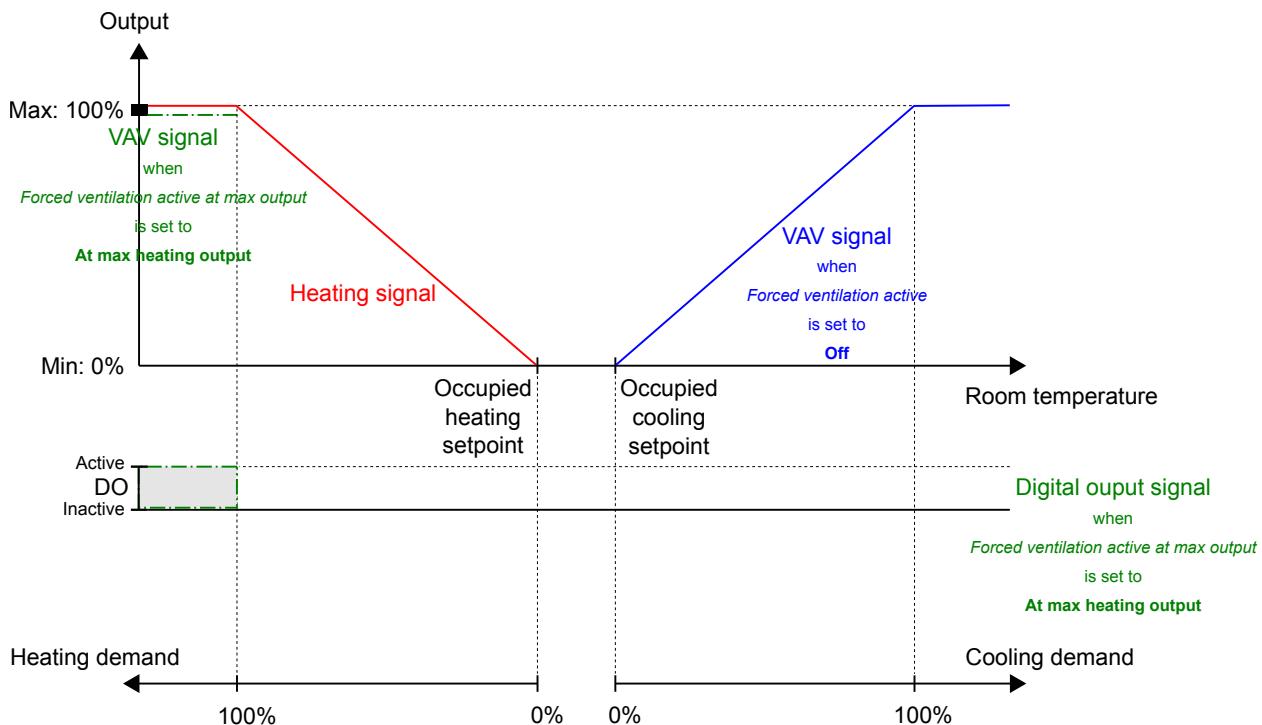

Figure 2-37 Example of forced ventilation control behaviour for the Heating + VAV controller mode when the controller is in bypass state.

Figure 2-38 illustrates the digital output signal behaviour for the Heating + Cooling controller mode when no maximum or minimum limits are set for the output signals, the controller is in bypass state, and the following configuration settings are applied:

- ✓ *Forced ventilation active: In cooling mode*
- ✓ *Forced ventilation active at max output: At max heating output*

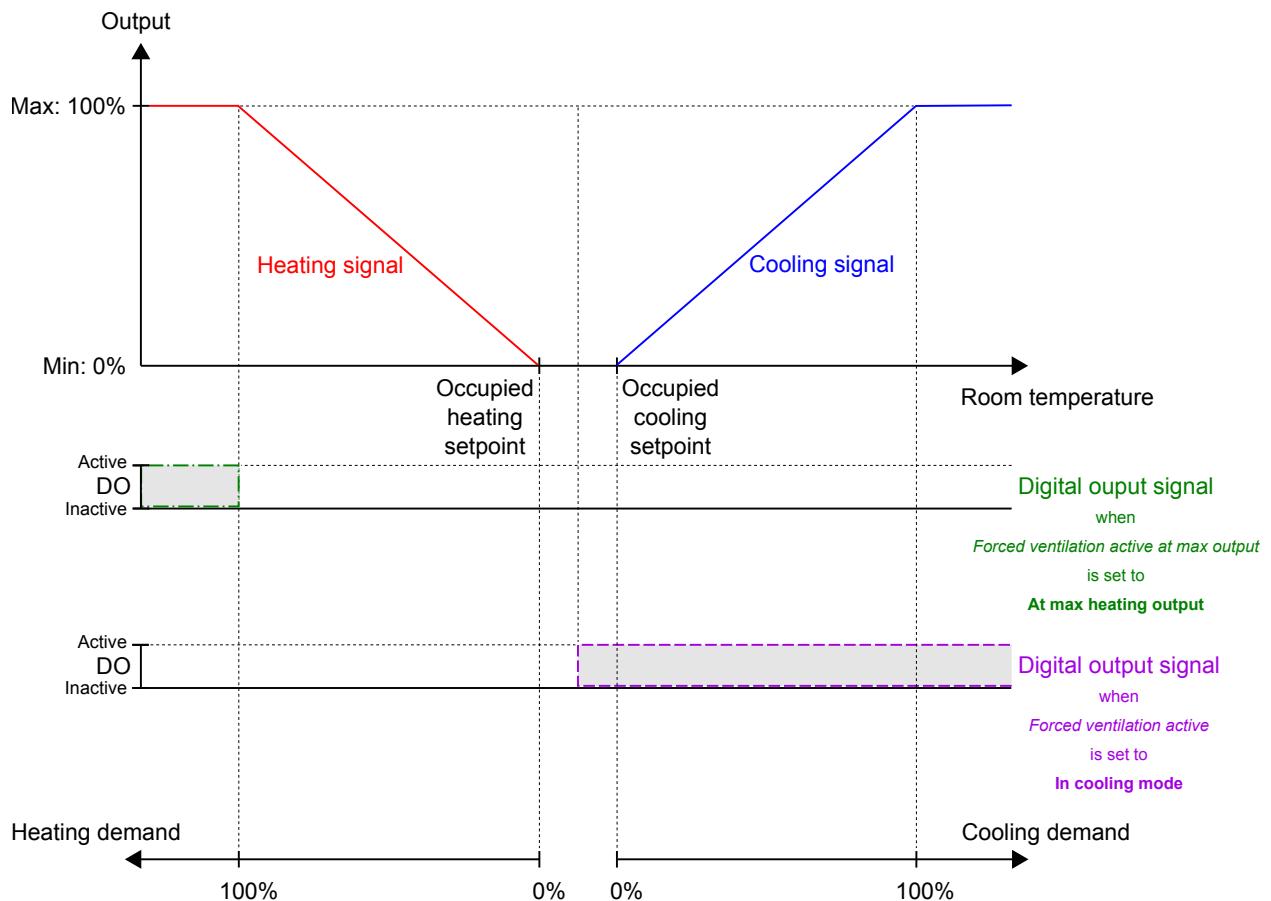

Figure 2-38 Example of forced ventilation control behaviour for the Heating + Cooling controller mode when the controller is in bypass state.

2.8 Presence detection

Presence detection is a control function that makes it possible for the controller to automatically switch between controller states based on if someone is present in the room, or if the CO₂ level in the room is too high. See section 2.4 for information about controller states, and controller state changes when using presence detection.

Presence detection is performed by using a presence detector, for example, a motion detector, that is connected to and configured on a digital controller input. Presence can also be detected by using a CO₂ sensor that measures the CO₂ level in the room, and is connected to and configured on an analog controller input. Regin's ED-RU-DOCS room unit has a built-in CO₂ sensor. When an ED-RU-DOCS room unit is connected, the controller recognizes the built-in CO₂ sensor automatically, and no controller input configuration is needed.

The controller checks for presence continuously when the controller is in the state specified by the *Preset controller state* setting, see section *Presence detection and occupancy (on/off) button on room unit*.

The presence detection function is enabled and the presence detection configuration settings are shown in Application tool when any of the configuration values listed in Table 2-24 are configured on a controller input, or when an ED-RU-DOCS room unit is selected as connected room unit, see the *Configuration -> Room unit* pane in Application tool.

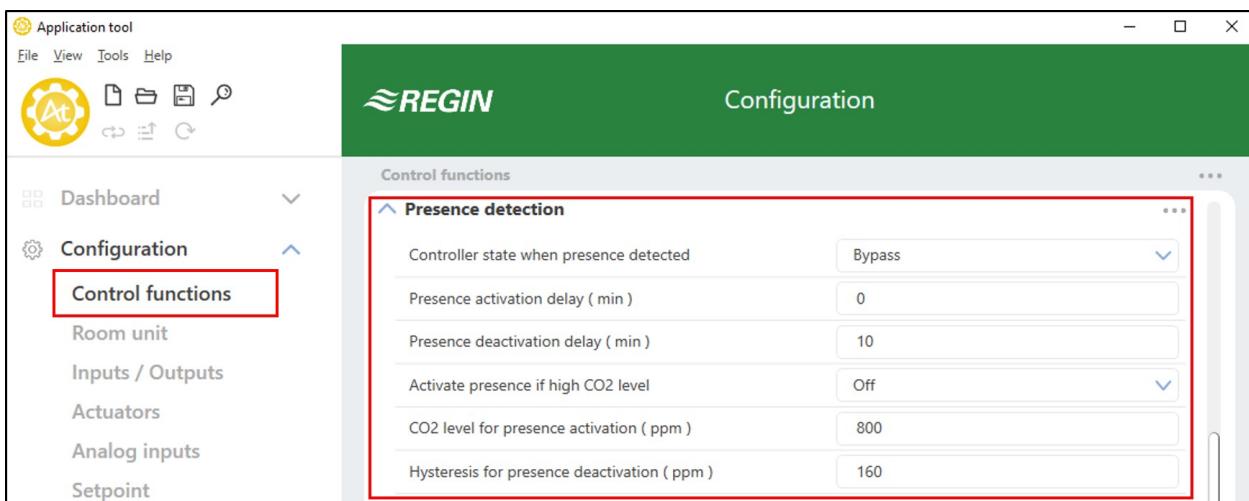

Figure 2-39 Presence detection configuration settings in Application tool.

Table 2-24 Presence detection configuration values and controller input types.

| Controller input configuration value | Controller input type |
|--------------------------------------|-----------------------|
| CO2 sensor | Analog |
| Presence detector | Digital |

The presence detection configuration settings are described in *Table 2-25*.

Table 2-25 Presence detection configuration settings.

| Configuration setting | Description |
|--|---|
| Controller state when presence detected | One of the following controller states is configured as active when presence is detected: <input checked="" type="checkbox"/> Occupied <input checked="" type="checkbox"/> Bypass (default setting) |
| Presence activation delay (min) | The controller checks for presence continuously when the controller is in the state specified by the <i>Preset controller state</i> setting. When presence is detected, a timer starts and the controller waits this delay time (in minutes) before changing to the state specified by the <i>Controller state when presence detected</i> setting. If presence is not detected continuously during this delay time, for example, if a person leaves the room before the delay time has passed, the controller does not change to the presence detected controller state, and the timer is stopped and reset. |
| Presence deactivation delay (min) | The controller checks for presence continuously when the controller is in the presence detected controller state. When no presence is detected anymore, a timer starts and the controller waits this delay time (in minutes) before changing to the state specified by the <i>Preset controller state</i> setting. If presence is detected again during this delay time, for example, if a person re-enters the room before the delay time has passed, the controller stays in the presence detected controller state, and the timer is stopped and reset. |
| Activate presence if high CO2 level | Off: Presence detection via the CO ₂ sensor is disabled. On: Presence is detected via the CO ₂ sensor by using the <i>CO₂ level for presence activation (ppm)</i> setting (default setting). |
| CO2 level for presence activation (ppm) | Presence is detected via the CO ₂ sensor when the measured CO ₂ level exceeds this value. |
| Hysteresis for presence deactivation (ppm) | Specifies the hysteresis for when presence is not detected via the CO ₂ sensor anymore. For example, if presence has been detected at 800 ppm and this setting is 160 ppm, the controller stops detecting presence at 800-160 = 640 ppm. |

2.9 Two rooms

Two rooms is a control function that enables the controller to control two separate rooms independently of each other.

For information about room unit identification in a two-room installation, see section 3.6.

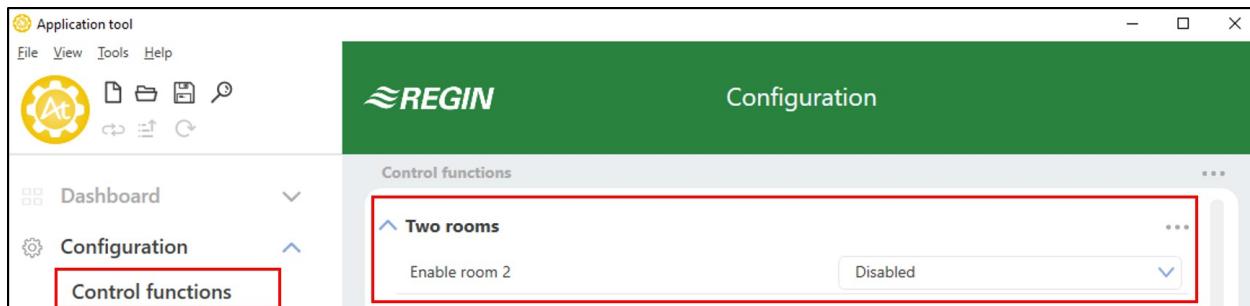

Figure 2-40 Two rooms configuration settings in Application tool.

When the two rooms function is enabled, all configuration settings for room 2 are displayed in all panes in Application tool. *Figure 2-41* shows, for example, how setpoint settings for room 1 and room 2 are displayed.

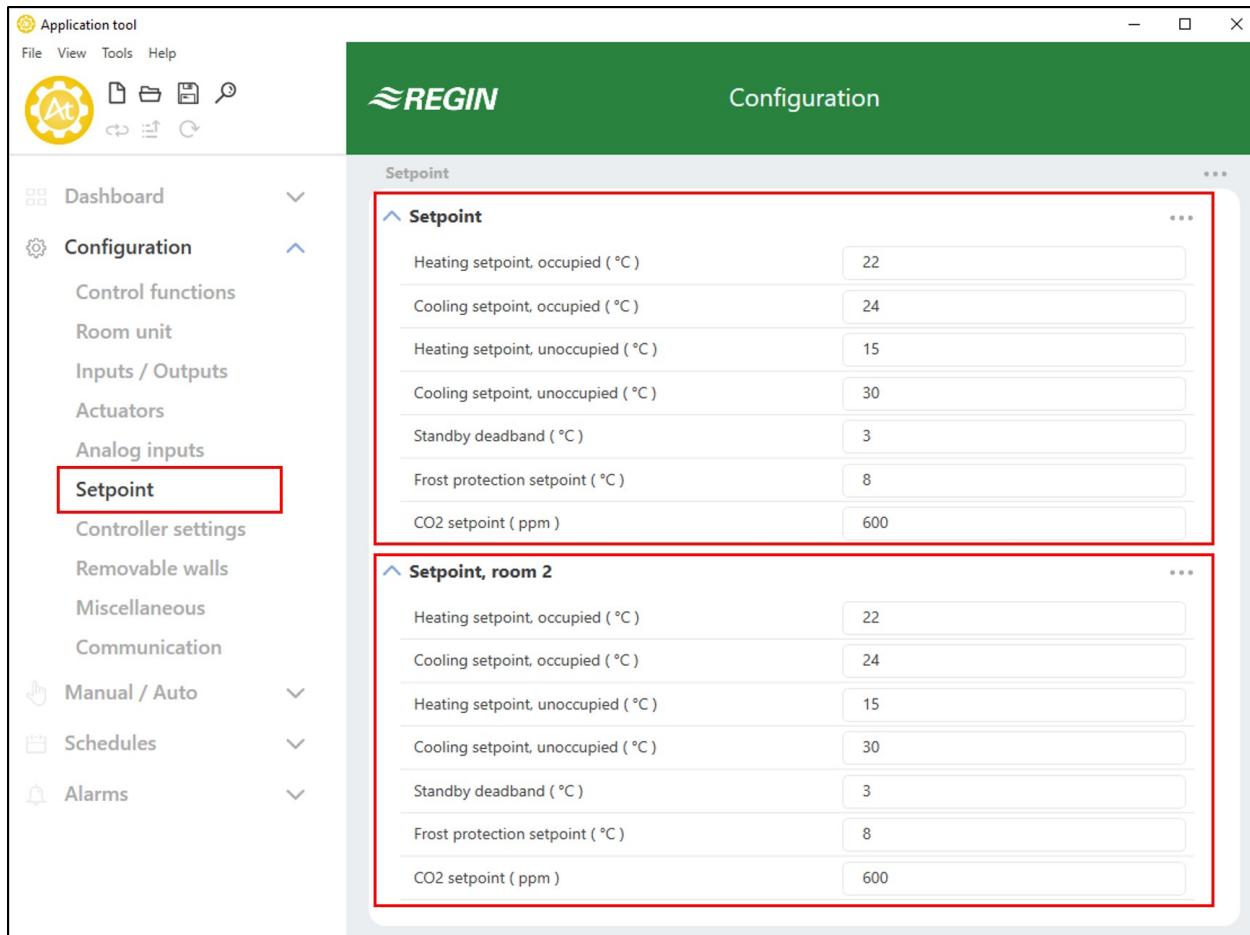

Figure 2-41 Example of room 2 configuration settings in Application tool.

The configuration settings for the two rooms function are described in *Table 2-26*.

Table 2-26 Configuration settings for the two rooms function.

| Configuration setting | Description |
|-----------------------|--|
| Enable room 2 | Disabled: Two-room control is disabled (default setting). Enabled: Two-room control is enabled. When the two rooms function is enabled, all configuration settings for room 2 are displayed in all panes in Application tool. |

2.10 CO₂ control

CO₂ control is a function that enables the controller to regulate based on fresh air demand. CO₂ control is performed by connecting a CO₂ sensor, and by letting the controller control the VAV output signal based on the CO₂ setpoint and the current CO₂ level in the room.

CO₂ control can be used together with the controller modes that include a VAV sequence:

- ✓ Heating + VAV
- ✓ Cooling + VAV
- ✓ VAV
- ✓ Heating + Cooling + VAV

CO₂ control is managed via the VAV control function, by applying the *VAV control* configuration setting, see section 2.6.

The CO₂ sensor is connected to and configured on an analog controller input by using the value listed in *Table 2-27*. Regin's ED-RU-DOCS room unit has a built-in CO₂ sensor. When an ED-RU-DOCS room unit is connected, the controller recognizes the built-in CO₂ sensor automatically, and no controller input configuration is needed.

Table 2-27 CO₂ control configuration value and controller input type.

| Configuration value | Controller input type |
|------------------------|-----------------------|
| CO ₂ sensor | Analog |

CO₂ control provides a specific setting, listed in *Table 2-28*, that is only applicable for the controller modes that include a cooling sequence. This setting is located in the *Configuration -> Control functions -> Controller mode* pane in Application tool, and is shown when an applicable controller mode is selected.

Table 2-28 CO₂ control configuration setting.

| Configuration setting | Description |
|--------------------------------|--|
| Cooling sequence controlled by | Cooling demand: The cooling output signal is controlled based on the cooling setpoint and the current room temperature (default setting). VAV control selection: The cooling output signal is controlled according to the <i>VAV control</i> setting, see section 2.6. That is, either by: <ul style="list-style-type: none"> ✓ Cooling demand ✓ CO₂ demand ✓ Cooling or CO₂, the highest demand |

Figure 2-42 illustrates the control behaviour for CO₂ control when a minimum limits is set for the VAV output signal.

The demand for fresh air increases as the CO₂ level in the room rises. When the CO₂ level rises above the CO₂ setpoint, *VAV signal* increases to respond to the fresh air demand. At 100% fresh air demand, *VAV signal* reaches its maximum.

Control functions

When the CO₂ level in the room is lower than the CO₂ setpoint and no fresh air demand exists, *VAV signal* is at its minimum.

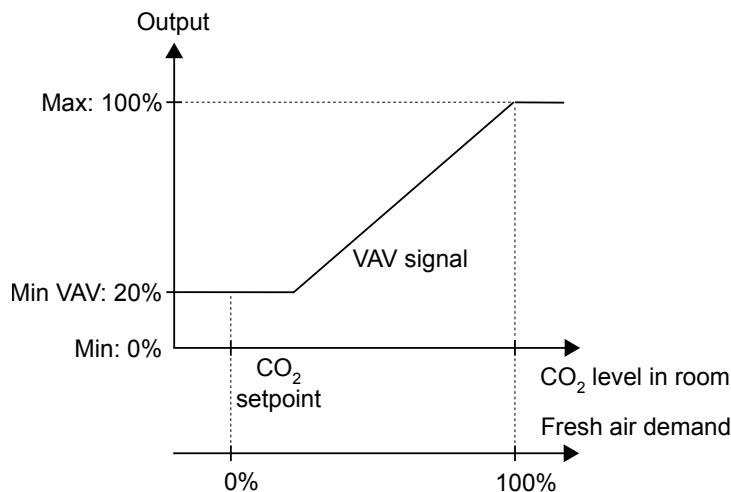

Figure 2-42 CO₂ control behaviour.

3 Room unit

A person in the room can control the room's HVAC behaviour by using a room unit that is connected to the controller. A room unit, depending on the model, lets the person in the room:

- ✓ Put the room HVAC system in a comfort or energy saving mode
- ✓ Perform a setpoint adjustment
- ✓ Improve the air quality in the room through a temporary increase in airflow
- ✓ Select a fan speed
- ✓ Turn the room lighting on or off
- ✓ Control sun blinds

Room unit models with display can be used to perform basic controller configuration, see section 3.3.5, as an alternative to using Application tool.

A room unit, depending on the model, is also used to provide status information to the person in the room regarding:

- ✓ Controller state
- ✓ If the controller is heating or cooling
- ✓ Room temperature
- ✓ CO₂ level in room
- ✓ Setpoint adjustment
- ✓ Fan speed
- ✓ If a window is open
- ✓ If a sun blind is out
- ✓ If the room lighting is on
- ✓ Relative humidity level in room
- ✓ Outdoor temperature

3.1 Model overview and user interface description

The controller supports various Regin ED-RU... room unit models, that is, room units with or without:

- ✓ **LEDs or display**
For providing status information.
Models without display are equipped with LEDs that indicate the current controller state, and if the controller is heating or cooling. For models with display, all types of indications are provided in the display.
- ✓ **Occupancy (on/off) button**
For putting the room HVAC system in a comfort or energy saving mode, see section 2.4, or for improving the air quality in the room through a temporary increase in airflow (if forced ventilation is activated, see section 2.7).
- ✓ **Up/down buttons or knob**
For performing a setpoint adjustment.
- ✓ **Fan speed button or switch**
For selecting a fan speed. That is, auto speed or manual (off, low, medium, or high) speed.

Room unit

✓ Temperature and CO₂ sensor

For measuring the temperature or CO₂ level in the room.

All models are equipped with a built-in temperature sensor, and the ED-RU-DOCS model includes a built-in CO₂ sensor.

✓ Multi-function button

For selecting a fan speed, controlling room lighting or sun blinds, or for viewing the outdoor temperature or relative humidity in the room.

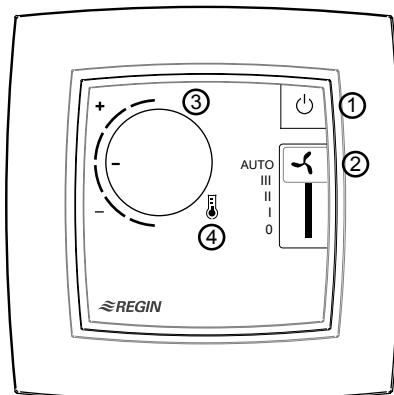

Only the ED-RU-DOS model is equipped with the multi-function button.

Table 3-1 shows an overview of the features that the different room unit models provide.

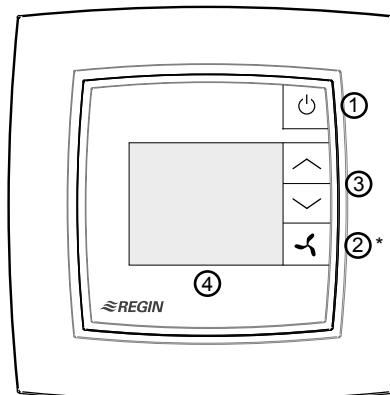

Table 3-1 Room unit features per model.

| Model | LEDs | Display | Occupancy (on/off) button | Up/down buttons for setpoint adjustment | Setpoint adjustment knob | Fan speed button | Fan speed switch | Temperature sensor | CO ₂ sensor | Multi-function button |
|------------|------|---------|---------------------------|---|--------------------------|------------------|------------------|--------------------|------------------------|-----------------------|
| ED-RU-H | | | | | | | | ✓ | | |
| ED-RU | ✓ | | | | ✓ | | | ✓ | | |
| ED-RU-F | ✓ | | | | ✓ | | ✓ | ✓ | | |
| ED-RU-O | ✓ | | ✓ | | ✓ | | | ✓ | | |
| ED-RU-FO | ✓ | | ✓ | | ✓ | | ✓ | ✓ | | |
| ED-RU-DO | | ✓ | ✓ | ✓ | | | | ✓ | | |
| ED-RU-DFO | | ✓ | ✓ | ✓ | | | ✓ | ✓ | | |
| ED-RU-DOS | | ✓ | ✓ | ✓ | | | | ✓ | | ✓ |
| ED-RU-DOCS | ✓ | ✓ | ✓ | ✓ | | | | ✓ | ✓ | |
| ED-RUD | | ✓ | ✓ | ✓ | | ✓ | | ✓ | | |

The room unit user interface is shown in *Figure 3-1*.

Room units without display

Room units with display

Figure 3-1 The ED-RU-FO room unit to the left and the ED-RU-DFO room unit to the right.

Table 3-2 describes the buttons, switch, knob, and LEDs that are available on room units with and without display.

Table 3-2 Button, switch, knob, and LED descriptions for room units with and without display.

| Room units without display | | Room units with display | |
|----------------------------|--|-------------------------|---|
| No | Description | No | Description |
| 1 | Occupancy (on/off) button with LED that indicates the controller state | 1 | Occupancy (on/off) button |
| 2 | Fan speed switch | 2 (*) | Fan speed button (*Multi-function button on the ED-RU-DOS model, see section 3.3.8) |
| 3 | Setpoint adjustment knob | 3 | Up/down buttons for setpoint adjustment |
| 4 | LED in temperature icon that indicates if the controller is heating or cooling | 4 | Display |

3.2 Room units without display

Figure 3-2 shows all the different room unit models without display.

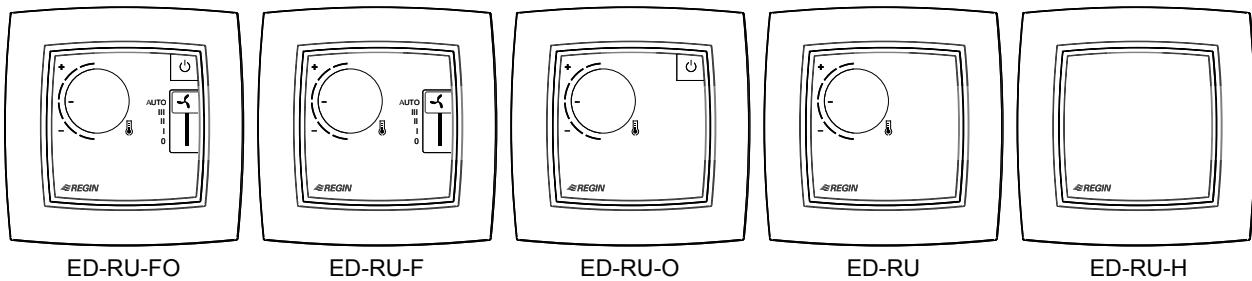

Figure 3-2 ED-RU... room unit models without display.

3.2.1 Selecting a fan speed

A fan speed is selected via the fan speed switch.

When the controller is in the state specified by the *Shutdown controller state* setting the fan speed is always auto, regardless of what is selected via the room unit.

3.2.2 Performing a setpoint adjustment

A setpoint adjustment is performed by turning the knob.

3.2.3 Putting the room HVAC system in a comfort/energy saving mode or increasing the airflow

A short press (<5 s) on the occupancy (on/off) button puts the room HVAC system in comfort mode (first in bypass controller state, and then by default in occupied controller state), and increases the airflow temporarily (if forced ventilation is activated).

A long press (>5 s) on the occupancy (on/off) button puts the room HVAC system in energy saving mode (by default in unoccupied controller state).

3.2.4 LED indications

The LEDs indicate the current controller state, and if the controller is heating or cooling. Table 3-3 describes the LED behaviour.

Table 3-3 LED indication descriptions.

| LED location | LED behaviour |
|--|---|
| In occupancy (on/off) button | Blinking slowly: The controller is in bypass state. Blinking: The controller is in standby state. Solid: The controller is in occupied state. Off: The controller is in unoccupied or off state. |
| In temperature icon in the centre of the room unit | Red solid: The controller is in heating mode and the demand is greater than zero. Blue solid: The controller is in cooling mode and the demand is greater than zero. Off: The demand is zero. |

3.3 Room units with display

Figure 3-3 shows all the different room unit models with display.

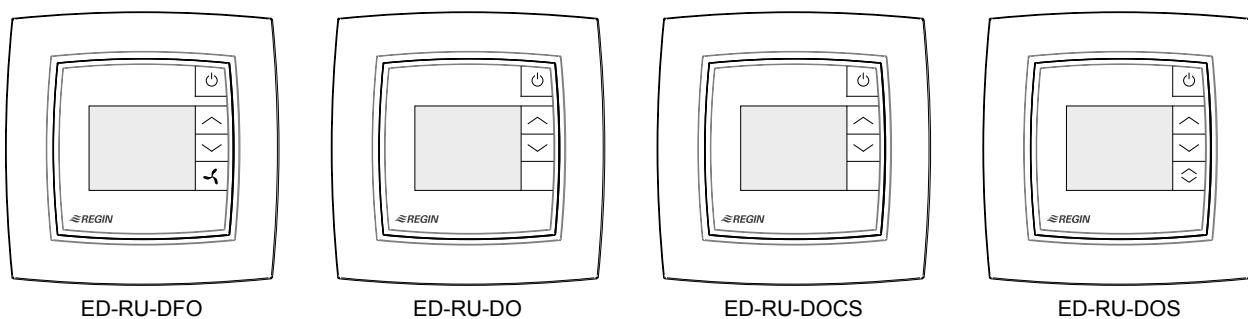

Figure 3-3 ED-RU... room unit models with display.

3.3.1 Selecting a fan speed

This instruction is only applicable for the ED-RU-DFO model. For information on selecting a fan speed on the ED-RU-DOS model, see section 3.3.8.

To select a fan speed:

1. Press the fan speed button to enter fan speed selection mode. The fan indication in the display starts to blink.
2. Press the fan speed button to scroll between the auto fan speed selection and the available (as configured in the controller) manual fan speed selections.
3. Press the occupancy (on/off) button to make the selection, or wait 10 seconds for the selection to be made automatically. After the selection has been made, the fan indication stops blinking.

When the controller is in the state specified by the *Shutdown controller state* setting the fan speed is always auto, regardless of what is selected via the room unit.

3.3.2 Performing a setpoint adjustment

For room units with display, a setpoint adjustment can be performed when the controller is in bypass, occupied, or standby state.

To perform a setpoint adjustment:

1. Press the up or down button to enter setpoint adjustment mode. The setpoint adjustment and up/down arrow indications in the display start to blink.
2. Press the up or down button to increase or decrease the setpoint adjustment, respectively. The selected setpoint adjustment value is shown in the display.

3. Press the occupancy (on/off) button to make the selection, or wait 5 seconds for the selection to be made automatically. After the selection has been made, the setpoint adjustment and up/down arrow indications stop blinking.

3.3.3 Putting the room HVAC system in a comfort/energy saving mode or increasing the airflow

A short press (<5 s) on the occupancy (on/off) button puts the room HVAC system in comfort mode (first in bypass controller state, and then by default in occupied controller state), and increases the airflow temporarily (if forced ventilation is activated).

A long press (>5 s) on the occupancy (on/off) button puts the room HVAC system in energy saving mode (by default in unoccupied controller state).

3.3.4 Display indications

The display indications are shown in *Figure 3-4*.

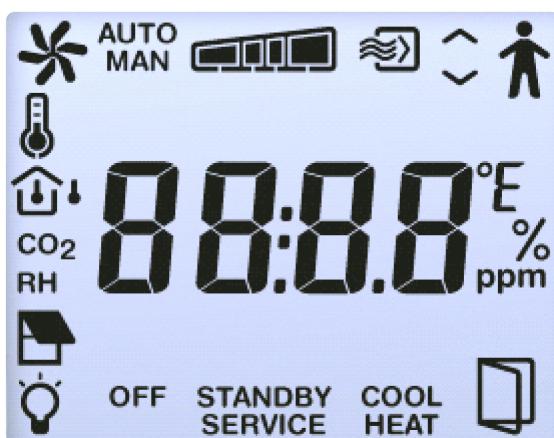

Figure 3-4 Indications in room unit display.

The display indications are described in *Table 3-4*.

Table 3-4 Display indication descriptions.

| Indication | Description |
|-----------------------|---|
| | Occupancy indication is shown when the controller is in occupied or bypass state. |
| STANDBY | Controller is in standby state. |
| OFF | Controller is in unoccupied or off state. |
| | Room temperature is shown. |
| CO₂ | CO ₂ level in room is shown. |
| | Solid: Setpoint or setpoint adjustment is shown (according to the current <i>View mode</i> setting, see section 3.9.4). Blinking: Setpoint adjustment is in progress by using the up and down buttons. |
| | Up/down arrows are blinking alternatively when setpoint adjustment is in progress. |

Room unit

Table 3-4 Display indication descriptions. (continued)

| Indication | Description |
|----------------|---|
| | Turning: The fan is active. Blinking: Fan speed selection is in progress. |
| AUTO | EC or 3-speed fan control in auto or manual mode. The fan speed is shown in the following ways: When 3 speeds is configured in the controller as number of used fan speeds, one of these indications is shown: No fan speed Fan speed 1 Fan speed 2 Fan speed 3 When 2 speeds is configured in the controller as number of used fan speeds, one of these indications is shown: No fan speed Fan speed 1 Fan speed 2 When 1 speed is configured in the controller as number of used fan speeds, one of these indications is shown: No fan speed Fan speed 1 |
| MAN | |
| HEAT | Controller is in heating mode and the demand is greater than zero. |
| COOL | Controller is in cooling mode and the demand is greater than zero. |
| | Forced ventilation is active. |
| SERVICE | Room unit is in service mode, in which the parameter menu can be accessed. |
| | Room window is open. |
| | Lighting is active. |
| | Sun blind is out. |
| RH | Relative humidity level in room is shown temporarily. Note: Only the ED-RU-DOS model supports showing the relative humidity level in the display. |
| | Outdoor temperature is shown temporarily. Note: Only the ED-RU-DOS model supports showing the outdoor temperature in the display. |

3.3.5 Basic controller configuration via the display

Basic controller configuration can be performed via the parameter menu in room units with display. The room unit display parameters are listed in *Appendix B*.

The parameter menu is divided into the following groups:

- ✓ **CTRL** - Controller mode, setpoint, P-band, and I-time settings
- ✓ **SYS** - Controller state, change-over, presence detection, and lighting control settings
- ✓ **ACTR** - Actuator settings
- ✓ **FAN** - Fan control settings
- ✓ **M/AT** - Manual / Auto settings
- ✓ **HMI** - Room unit settings
- ✓ **IO** - Input / Output settings

✓ ALAM - Alarm settings

To access the parameter menu and set a parameter value:

1. Press the up and down buttons simultaneously, for about 5 seconds, until the SERVICE indication is shown in the display.
2. Press the up button twice to enter the parameter menu. The CTRL group heading is shown by default.
3. Use the up or down button to scroll to the applicable group heading, and then press the occupancy (on/off) button to access the parameters in the group.
4. Use the up or down button to scroll to the applicable parameter, and then press the occupancy (on/off) button to enter edit mode for the parameter.
5. Use the up or down button to select a parameter value, and then press the occupancy (on/off) button to set the selected value. During parameter value selection, the currently set value can be retrieved by pressing the up and down buttons simultaneously.

Back navigation in the parameter menu structure can be done in the following ways:

- ✓ Press the up and down buttons simultaneously.
- ✓ Use the up or down button to scroll to the EXIT value and then press the occupancy (on/off) button.

The display returns to normal view mode after 2 minutes of inactivity in the parameter menu.

3.3.6 Parameter menu access

Access to the parameter menu in room units with display can be disabled to prevent unauthorized users to perform basic controller configuration.

The configuration setting for disabling or enabling access to the parameter menu is listed in section 3.9.4.

3.3.7 Display background lighting

The display background is lit, and dimmed after 2 minutes of inactivity, when the controller is in:

- ✓ Bypass state
- ✓ The state specified by the *Preset controller state* setting
- ✓ The state specified by the *Controller state when presence detected* setting

The display background is not lit when the controller is in the state specified by the *Shutdown controller state* setting.

Configuration options for setting the display background brightness are listed in section 3.9.4.

3.3.8 ED-RU-DOS functions

ED-RU-DOS is a multipurpose room unit with display. In addition to having up/down buttons for setpoint adjustment and an occupancy (on/off) button for putting the room HVAC system in comfort or energy saving mode, this model is equipped with a multi-function button () that can be used for:

- ✓ **Selecting a fan speed** - auto fan speed or the available (as configured in the controller) manual fan speeds
- ✓ **Performing a setpoint adjustment** - increase or decrease

- ✓ Temporarily viewing:
 - ✓ Room and outdoor temperature
 - ✓ CO₂ level in the room
 - ✓ Relative humidity in the room
- ✓ Controlling sun blinds - send in/out or stop
- ✓ Controlling room lighting - turn on/off

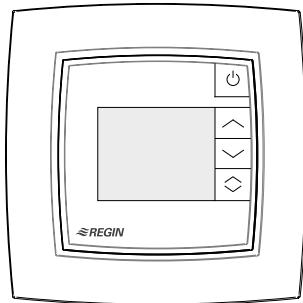

Figure 3-5 ED-RU-DOS room unit.

To perform an action in the multi-function menu:

1. Press to scroll between the items in the multi-function menu. The current item blinks.
2. Press the up or down button to modify the value for current item.
3. Press the occupancy (on/off) button to select the modified value, or wait 10 seconds for the selection to be made automatically. After the selection has been made, the display returns to normal view mode.

When the controller is in the state specified by the *Shutdown controller state* setting the fan speed is always auto, regardless of what is selected via the room unit.

3.4 Communication LED

An LED is located inside the lower right corner of the room unit and blinks when the room unit is communicating with the controller.

The blinking is visible when the frame on top of the room unit is removed, and the room unit is communicating.

3.5 Enable or disable buttons/switch and knob

The buttons, fan switch, and setpoint adjustment knob on the room unit can be enabled or disabled in different ways to restrict end-user control. Note that the parameter menu in room units with display is accessible even if the up/down buttons are not enabled.

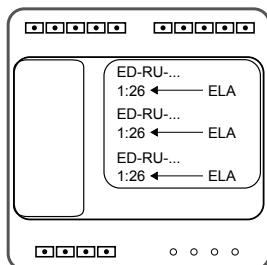

Configuration options for enabling or disabling buttons, the fan switch, or the setpoint adjustment knob are listed in section 3.9.5.

3.6 Two-room installation

Follow these steps to ensure that the controller automatically associates the connected room units with room 1 and room 2:

1. Make sure that the two room units have different ELA addresses. The room unit with the lowest ELA will be assigned to room 1.

The ELA address has the format 1:[1-30] and is printed on a label that is located on the back of the room unit PCB, as shown in the following figure.

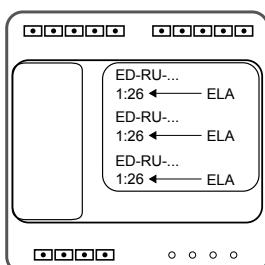

2. Connect both room units to the controller using the cable splitter.
3. In Application tool, connect to the controller and enable the two rooms function via the *Enable room 2* configuration setting. The *Enable room 2* setting is located in the *Configuration -> Control functions* pane.
Load/synchronize the *Enable room 2* parameter to the controller.
4. Allow the controller to identify the room units, which takes up to 45 seconds.
For room units without display, the LED in the centre of the room unit blinks red and blue during the identification phase. The controller has completed the identification when the LED stops blinking.
For room units with display, *FAIL* or is shown in the display during the identification phase. The controller has completed the identification when neither *FAIL* nor is shown.
After the room units have been identified by the controller, Application tool provides support functions for checking assigned room unit IDs, and for swapping IDs between room units, see section 3.9.2.

3.7 Two-room installation (alternative method)

In a two-room installation, make note of the ELA addresses for the room units in room 1 and room 2. Also, make sure the two room units have different ELA addresses.

The ELA address has the format 1:[1-30] and is printed on a label that is located on the back of the room unit PCB, as shown in the following figure.

1. Start the controller with both room units connected.
2. In Application tool, connect to the controller and enable the two rooms function via the *Enable room 2* configuration setting. The *Enable room 2* setting is located in the *Configuration -> Control functions* pane.
Then load/synchronize the *Enable room 2* parameter to the controller.
3. In Application tool, in the *Configuration -> Room unit* pane, select *Connected room unit* and enter *Room unit ELA*, 1-30, for both rooms.
Then load/synchronize the parameters to the controller.

4. For room units without display, the LED in the centre of the room unit blinks red and blue during the identification phase. The controller has completed the identification when the LED does not blink red and blue anymore.

For room units with display, *FAIL* or  is shown in the display during the identification phase. The controller has completed the identification when neither *FAIL* nor  is shown anymore.

3.8 Wiring

For information on how to wire the ED-RU... unit and connect it to the controller, see section 7.

3.9 Configuration settings

The room unit configuration settings are described in the following sections.

3.9.1 General

This section describes the general configuration settings.

Table 3-5 General configuration settings.

| Configuration setting | Description |
|-----------------------|---|
| Connected room unit | <p>The room unit model that is used in the room HVAC system:</p> <ul style="list-style-type: none"><input checked="" type="checkbox"/> None<input checked="" type="checkbox"/> ED-RU<input checked="" type="checkbox"/> ED-RU-O<input checked="" type="checkbox"/> ED-RU-F<input checked="" type="checkbox"/> ED-RU-FO<input checked="" type="checkbox"/> ED-RU-DO<input checked="" type="checkbox"/> ED-RU-DFO<input checked="" type="checkbox"/> ED-RU-DOS<input checked="" type="checkbox"/> ED-RU-H<input checked="" type="checkbox"/> ED-RU-DOCS<input checked="" type="checkbox"/> ED-RUD (Modbus) <p>This setting is used for configuration purposes, that is, for displaying relevant configuration settings in Application tool that are related to the specific room unit model.</p> |
| Room unit address | <p>Specifies the room unit ELA or Modbus address that the controller uses for communication with the room unit.</p> <p>The ELA address has the format 1:[1-30] and is printed on a label that is located on the back of the room unit PCB.</p> <p>0: The controller automatically identifies the ELA address of the connected room unit (default setting).</p> <p>1, 2, 3...28, 29, 30: The controller only communicates with a connected room unit that has this ELA address.</p> |

3.9.2 Two rooms support functions

Application tool provides support functions for checking the room unit IDs, and for swapping the IDs between the room units. A search for and identification of connected room units can also be initiated. This can be useful, for example, if the initial automatic search and identification did not succeed.

Table 3-6 lists the configuration settings that are used to enable these functions. The configuration settings are shown in Application tool when the *Enable room 2* setting is enabled, see section 2.9.

Table 3-6 Two rooms support functions.

| Configuration setting | Description |
|--|--|
| Show room unit ID | Disabled: The room units do not indicate their room unit IDs (default setting). Enabled: The room units indicate their room unit IDs. For room units without display, the LED in the centre of the room unit blinks. One slow blink indicates ID 1 and two fast blinks indicate ID 2. For room units with display, ID 1 and ID 2 are shown in the displays. When the indications are shown in room units with display, the IDs can be swapped between the room units by pressing the up or down button on any of the room units. The indications are shown until the occupancy (on/off) button on any of the room units is pressed. |
| Show room unit ID at controller power up | Disabled: The room units do not indicate their room unit IDs at controller power up (default setting). Enabled: The room units indicate their room unit IDs at controller power up. For room units without display, the LED in the centre of the room unit blinks. One slow blink indicates ID 1 and two fast blinks indicate ID 2. For room units with display, ID 1 and ID 2 are shown in the displays. When the indications are shown in room units with display, the IDs can be swapped between the room units by pressing the up or down button on any of the room units. The indications are shown for 1 minute or until the occupancy (on/off) button on any of the room units is pressed. |
| Search for and identify room units | Disabled: No search is performed (default setting). Enabled: The controller initiates a search for and identification of the room units that are connected to the controller. |
| Swap room unit IDs | Disabled: The room unit IDs are not swapped (default setting). Enabled: The room unit IDs are swapped between the room units. |

3.9.3 Max setpoint adjustment

This section describes the max setpoint adjustment configuration settings.

Table 3-7 Max setpoint adjustment configuration settings.

| Configuration setting | Description |
|-----------------------------------|---|
| Max setpoint adjustment up (°C) | Specifies the maximum allowed setpoint adjustment up. |
| Max setpoint adjustment down (°C) | Specifies the maximum allowed setpoint adjustment down. |

3.9.4 Display

This section describes the display configuration settings.

Table 3-8 Display configuration settings.

| Configuration setting | Description |
|---|---|
| View mode | <p>One of the following options is selected:</p> <ul style="list-style-type: none"> ✓ Temperature: The room temperature is shown (default setting). ✓ Heating setpoint: The occupied heating setpoint, including setpoint adjustment, is shown. ✓ Cooling setpoint: The occupied cooling setpoint, including setpoint adjustment, is shown. ✓ Average of cooling and heating setpoint: The average of the occupied cooling and heating setpoint, including setpoint adjustment, is shown. ✓ Setpoint adjustment: The setpoint adjustment is shown. ✓ CO₂ level: The CO₂ level in the room is shown. |
| View mode during setpoint adjustment | <p>One of the following options is selected:</p> <ul style="list-style-type: none"> ✓ Setpoint adjustment: The setpoint adjustment is shown (default setting). ✓ Controlling setpoint: The occupied heating or cooling setpoint, including setpoint adjustment, that is used for control is shown. ✓ Heating setpoint: The occupied heating setpoint, including setpoint adjustment, is shown. ✓ Cooling setpoint: The occupied cooling setpoint, including setpoint adjustment, is shown. |
| Alternate between view mode setting and CO ₂ level | <p>Enabled: The display alternates between showing the current <i>View mode</i> setting and the CO₂ level in the room (default setting).</p> <p>Disabled: The current <i>View mode</i> setting is shown.</p> |
| Brightness when lit (%) | Specifies the display background brightness when lit. |
| Brightness when dimmed (%) | Specifies the display background brightness when dimmed. The brightness is dimmed after 2 minutes of inactivity. |
| Parameter menu access | <p>Enabled: The parameter menu is accessible (default setting).</p> <p>Disabled: The parameter menu is not accessible.</p> |

3.9.5 Buttons/switch and knob

This section describes the buttons/switch and knob configuration settings.

Table 3-9 Buttons/switch and knob configuration settings.

| Configuration setting | Description |
|---|---|
| Enabled buttons/switch and knob | <p>One of the following options is selected:</p> <ul style="list-style-type: none"> ✓ All disabled ✓ Occupancy button ✓ Fan button/switch ✓ Up/down buttons, knob ✓ Occupancy button, up/down buttons, knob ✓ Fan button/switch, up/down buttons, knob ✓ All enabled (default setting) <p>Note: The parameter menu in room units with display is accessible even if the up/down buttons are not enabled.</p> |
| Occupancy button press time for shutdown controller state (s) | The period of time (in seconds) that the occupancy button must be pressed (long press) for the controller to change to the state specified by the <i>Shutdown controller state</i> setting. |

4 Inputs / Outputs

The controller inputs and outputs are configurable. *Figure 4-1* shows the *Inputs / Outputs* pane in Application tool.

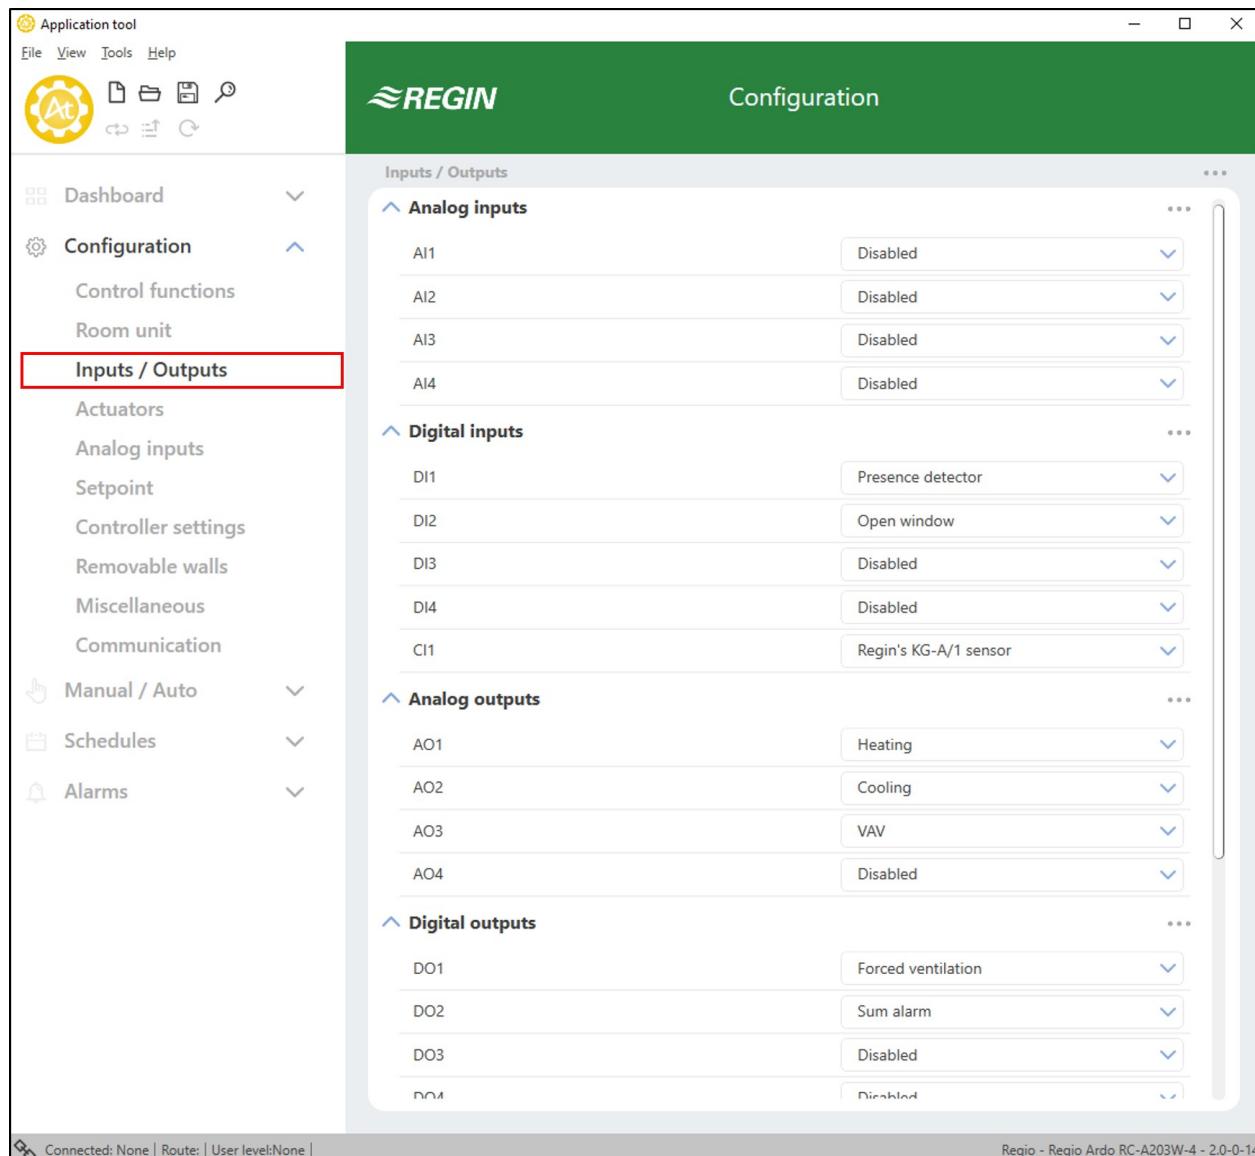

Figure 4-1 Controller input and output configuration in Application tool.

Table 4-1 provides an overview of the controller inputs and outputs, and lists their configuration options. The **room 2** configuration values are shown and selectable when the two rooms function is enabled, see section 2.9.

Inputs / Outputs

Table 4-1 Controller inputs and outputs, and their configuration options.

| Input or output | Type | Configuration value options |
|--------------------------|--------------------|---|
| AI1 AI2 AI3 AI4 | Analog input, Ala | <ul style="list-style-type: none"> ✓ Disabled ✓ Change-over temperature ✓ External room temperature ✓ Outdoor temperature ✓ Supply air temperature ✓ Condensation sensor ✓ CO2 sensor ✓ RH sensor ✓ External room temperature, room 2 ✓ Outdoor temperature, room 2 ✓ Supply air temperature, room 2 ✓ Condensation sensor, room 2 ✓ CO2 sensor, room 2 ✓ RH sensor, room 2 |
| DI1 DI2 DI3 DI4 | Digital input, Dlb | <ul style="list-style-type: none"> ✓ Disabled ✓ Change-over ✓ Open window ✓ Presence detector ✓ Open window, room 2 ✓ Presence detector, room 2 |
| CI1 CI2 | Digital input, Cla | <ul style="list-style-type: none"> ✓ Disabled ✓ Regin's KG-A/1 sensor ✓ Regin's KG-A/1 sensor, room 2 |
| AO1 AO2 AO3 AO4 | Analog output, AOa | <ul style="list-style-type: none"> ✓ Disabled ✓ Heating ✓ Heating 2 ✓ Cooling ✓ Change-over valve ✓ 6-way valve ✓ VAV ✓ EC fan ✓ Heating, room 2 ✓ Heating 2, room 2 ✓ Cooling, room 2 ✓ Change-over valve, room 2 ✓ 6-way valve, room 2 ✓ VAV, room 2 ✓ EC fan, room 2 |

Table 4-1 Controller inputs and outputs, and their configuration options. (continued)

| Input or output | Type | Configuration value options |
|-----------------|---------------------|--|
| DO1 | Digital output, DOd | ✓ Disabled ✓ Fan speed 1 ✓ Fan speed 2 ✓ Fan speed 3 ✓ Lighting ✓ Blind in ✓ Blind out ✓ Forced ventilation ✓ Heating valve, increase ✓ Heating valve, decrease ✓ Heating valve, thermal (PWM) ✓ Heating valve 2, increase ✓ Heating valve 2, decrease ✓ Heating valve 2, thermal (PWM) ✓ Cooling valve, increase ✓ Cooling valve, decrease ✓ Cooling valve, thermal (PWM) ✓ Change-over valve, increase ✓ Change-over valve, decrease ✓ Change-over valve, thermal (PWM) ✓ 6-way valve, increase ✓ 6-way valve, decrease ✓ Sum alarm ✓ Sum alarm A ✓ Sum alarm B ✓ Fan speed 1, room 2 ✓ Fan speed 2, room 2 ✓ Fan speed 3, room 2 ✓ Lighting, room 2 ✓ Blind in, room 2 ✓ Blind out, room 2 ✓ Forced ventilation, room 2 ✓ Heating valve, increase, room 2 ✓ Heating valve, decrease, room 2 ✓ Heating valve, thermal (PWM), room 2 ✓ Heating valve 2, increase, room 2 ✓ Heating valve 2, decrease, room 2 ✓ Heating valve 2, thermal (PWM), room 2 ✓ Cooling valve, increase, room 2 ✓ Cooling valve, decrease, room 2 ✓ Cooling valve, thermal (PWM), room 2 ✓ Change-over valve, increase, room 2 ✓ Change-over valve, decrease, room 2 ✓ Change-over valve, thermal (PWM), room 2 ✓ 6-way valve, increase, room 2 ✓ 6-way valve, decrease, room 2 ✓ Sum alarm, room 2 ✓ Sum alarm A, room 2 ✓ Sum alarm B, room 2 |
| DO2 | | |
| DO3 | | |
| DO4 | | |
| DO5 | | |
| DO6 | | |

5 Setpoint

Different setpoint and deadband settings are used by the different controller states, see section 2.4, to regulate the heating and cooling distribution. *Figure 5-1* shows the setpoint and deadband configuration settings in Application tool.

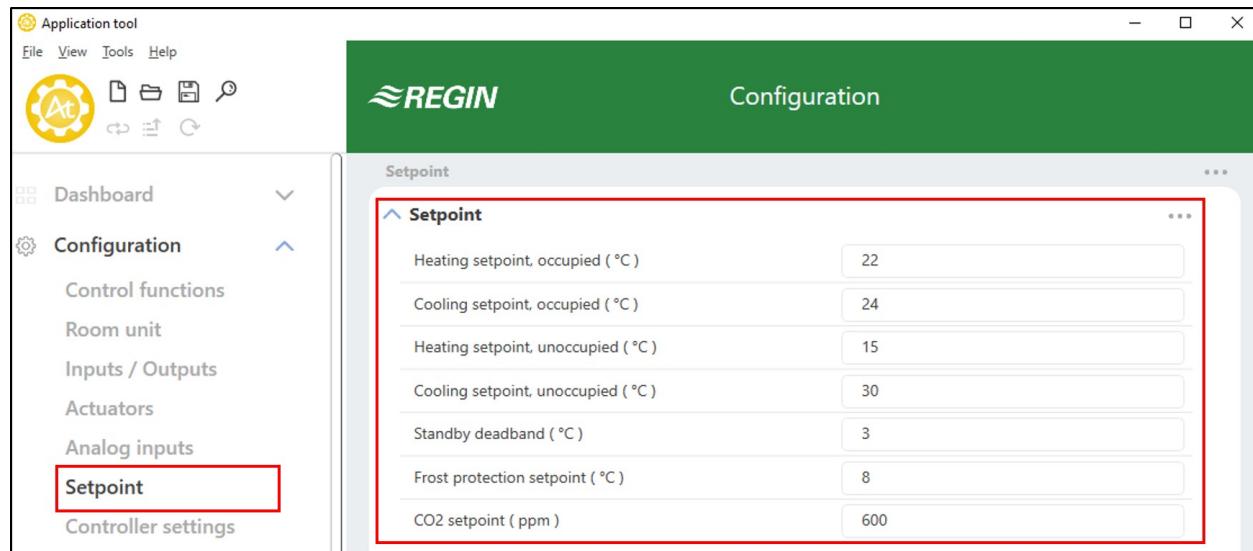

Figure 5-1 Setpoint and deadband configuration settings in Application tool.

An overview of the setpoint and deadband configuration settings are provided in *Table 5-1*.

Table 5-1 Setpoint and deadband settings overview.

| Configuration setting | Controller state applicability |
|-----------------------------------|---|
| Heating setpoint, occupied (°C) | ✓ Standby ✓ Occupied ✓ Bypass |
| Cooling setpoint, occupied (°C) | |
| Heating setpoint, unoccupied (°C) | ✓ Unoccupied |
| Cooling setpoint, unoccupied (°C) | |
| Standby deadband (°C) | ✓ Standby |
| Frost protection setpoint (°C) | ✓ Off |
| CO2 setpoint (ppm) | ✓ Unoccupied ✓ Standby ✓ Occupied ✓ Bypass |

5.1 Active setpoint

The active setpoint is the setpoint value currently being used for control. The active setpoint is determined by:

- ✓ The current controller state in use.
- ✓ The configured setpoint and deadband settings.
- ✓ Any applied setpoint adjustment. Note that setpoint adjustment is not active in certain controller states.

See section 2.4.1 for descriptions of the control behaviour for the controller states, including how the active heating and cooling setpoints are defined in each controller state.

5.2 Setpoint adjustment

The active setpoint can be raised or lowered by performing a setpoint adjustment. A setpoint adjustment is performed via the setpoint knob or the buttons on the room unit, or via communication.

A setpoint adjustment shifts both the active heating and cooling setpoints by equal measure. For example, if a +1 °C setpoint adjustment is applied, both the active heating and cooling setpoint are raised by +1 °C.

Maximum limits (up and down) for the setpoint adjustment can be set via configuration, see the *Configuration -> Room unit* pane in Application tool.

6 Removable walls

Removable walls is a function that enables one controller to act as a master that controls up to four other slave controllers. This is useful in large spaces that are equipped with several heating, cooling, or VAV devices, and where a uniform climate control throughout the whole space is needed. Typical applications where the removable walls function is useful are large conference rooms or open-plan offices that are equipped with removable walls.

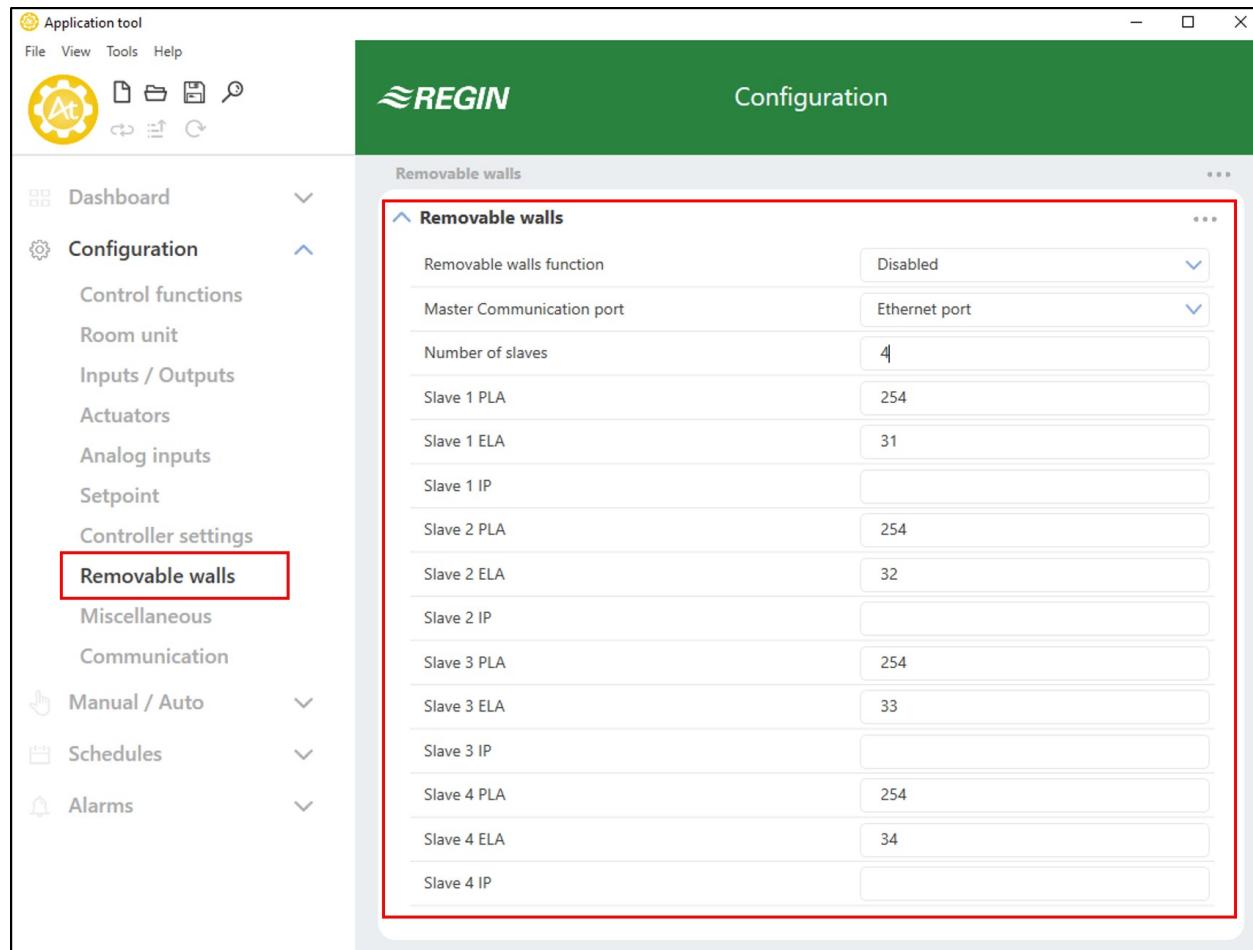

Figure 6-1 Removable walls configuration settings in Application tool.

When the removable walls function is enabled, a shared zone that includes the master and the configured slaves is established. The master collects measurements from all the slaves, and calculates an average that it uses as baseline to determine the control demand data that applies for the whole shared zone. Only the configuration settings in the master are used to determine the control demand data that is used for controlling the shared zone.

After the master has determined the control demand data, the master sends the same data to all the slaves. Each controller in the shared zone then uses the control demand data to generate output signals corresponding to its connected devices. This means that any unique set of heating, cooling, or VAV devices that are configured on a slave in the shared zone perform according to the control demand data that is determined by the master.

If the master loses communication with a slave, the slave reverts to standalone operation and starts to control its connected heating, cooling, or VAV devices according to its own configuration settings.

Each room unit that is connected to the master or any slave in the shared zone is active. This means that the latest setting change performed in any of the room units is accepted by the master and is visible in all the other room units.

6.1 Master controller configuration

The controller that acts as master is configured by using the settings that are described in *Table 6-1*.

The PLA and ELA, and IP addresses for each slave must be entered in the master configuration. The slave unit PLA and ELA addresses are clearly labelled on the slave controller casings.

If the master uses port 1 or port 2 for communication with the slaves, the *Port [nr] function* setting must be configured with the value **Exoline master**. The *Port [nr] function* setting is located in the *Configuration -> Communication -> Communication settings* pane in Application tool.

If the master uses the Ethernet port for communication with the slaves, no configuration is needed in the *Configuration -> Communication -> Communication settings* pane.

If the master configuration settings need to be modified after an initial configuration has been performed, do the following:

1. Disable the removable walls function.
2. Synchronize parameters.
3. Edit the master configuration settings.
4. Enable the removable walls function.
5. Synchronize parameters.

Table 6-1 Removable walls configuration settings in the master controller.

| Configuration setting | Description |
|---------------------------|--|
| Removable walls function | Disabled: The removable walls function is disabled (default setting). Enabled: The removable walls function is enabled. |
| Master communication port | Specifies the communication port that the master uses to communicate data related to the removable walls function: <input checked="" type="checkbox"/> Ethernet port (default setting) <input checked="" type="checkbox"/> Port 1 <input checked="" type="checkbox"/> Port 2 |
| Number of slaves | Specifies the number of slaves that are in use. |
| Slave [nr] PLA | The PLA address for slave [nr]. |
| Slave [nr] ELA | The ELA address for slave [nr]. |
| Slave [nr] IP | The IP address for slave [nr]. |

6.2 Slave controller configuration

If a slave uses port 1 or port 2 for communication with the master, the *Port [nr] function* setting must be configured with the value **Exoline slave**. The *Port [nr] function* setting is located in the *Configuration -> Communication -> Communication settings* pane in Application tool.

If a slave uses its Ethernet port for communication with the master, no configuration needs to be performed in the slave.

7 Controller connections and wiring diagrams

The controller connections are shown in *Figure 7-1* and described in *Table 7-1*.

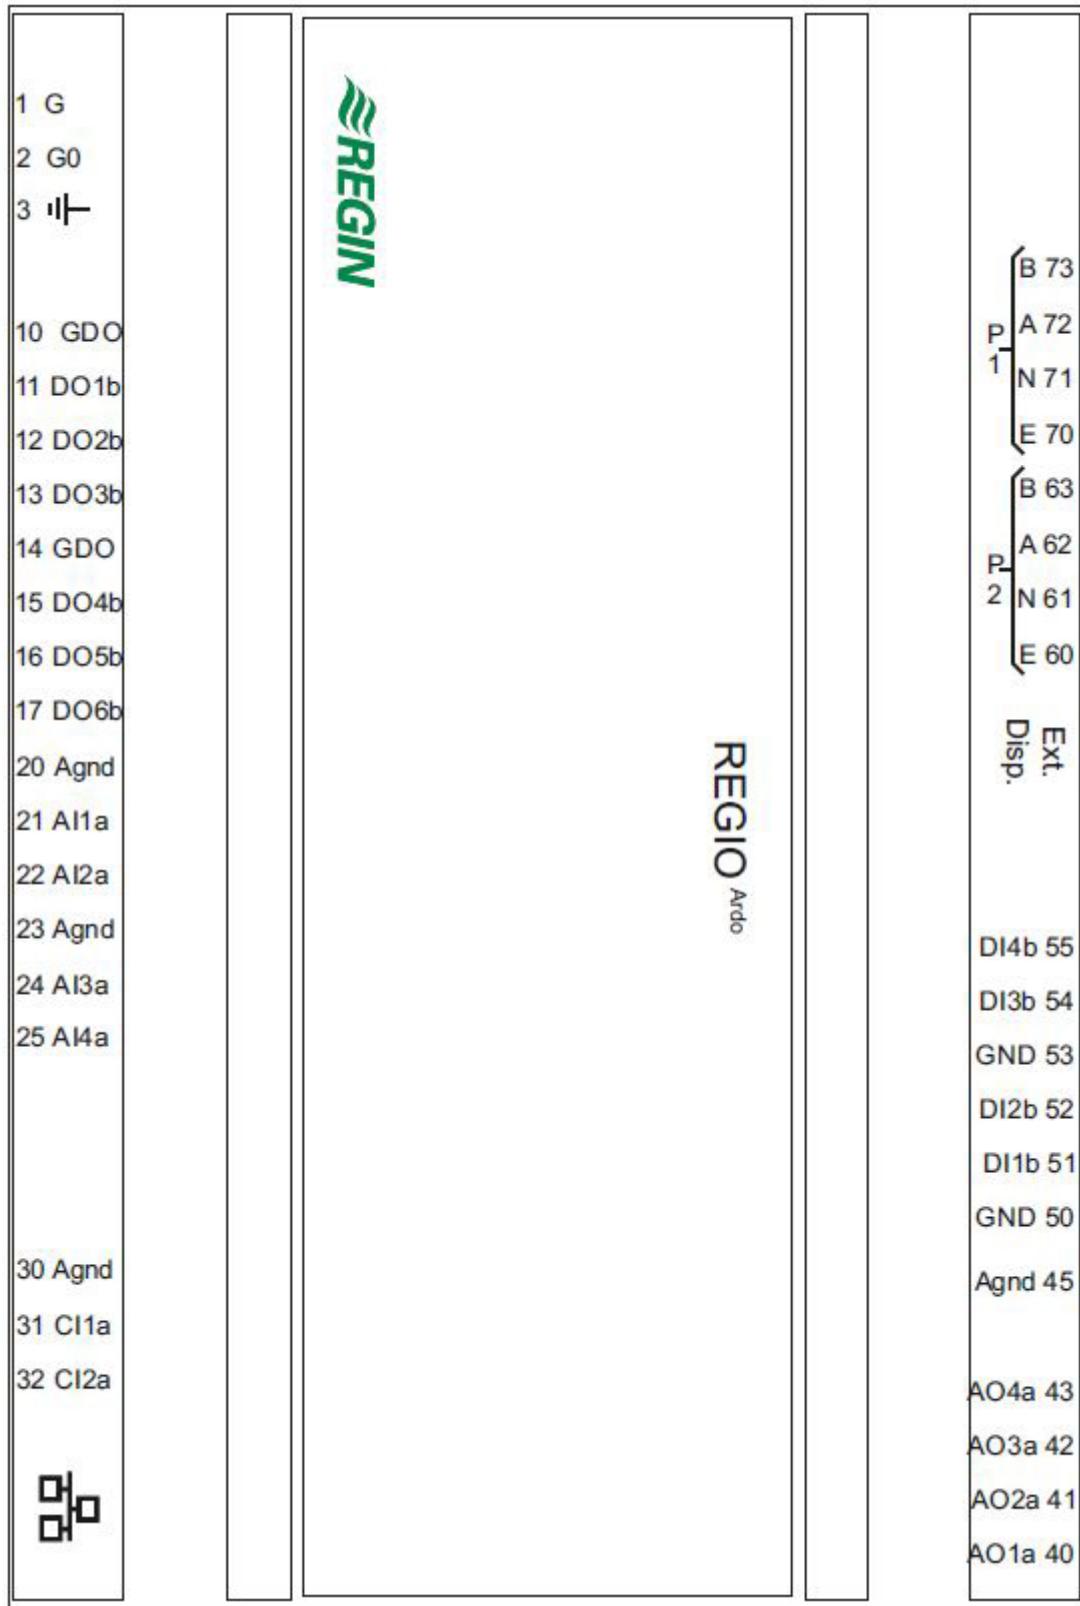

Figure 7-1 Controller connections layout.

Table 7-1 Controller connection descriptions.

| Terminal № and designator | Type | Description |
|--|-------------------------------------|---|
| 1 G | Supply voltage | 24 V AC supply voltage. |
| 2 G0 | Supply voltage (reference) | 24 V AC supply voltage (reference). |
| - | Ground | Earth ground. |
| 10 GDO 14 GDO | Supply voltage output | 24 V AC supply voltage output for use together with digital outputs. |
| 11 DO1b 12 DO2b 13 DO3b 15 DO4b 16 DO5b 17 DO6b | Digital output | Mosfet output used for valve, 3-speed fan, blinds, or lighting control, or for alarms or forced ventilation. |
| 20 Agnd 23 Agnd 30 Agnd 45 Agnd | Analog ground | Signal ground for analog inputs and outputs. |
| 21 AI1a 22 AI2a 24 AI3a 25 AI4a | Analog input | Input used for change-over detection or for temperature, CO ₂ , condensation, or relative humidity sensor. |
| 31 CI1a 32 CI2a | Condensation input | Input dedicated for Regin's condensation detector KG-A/1. |
|  | Ethernet communication port | 8P8C modular connector used for Ethernet - TCP/IP communication. |
| 40 AO1a 41 AO2a 42 AO3a 43 AO4a | Analog output | Output used for valve, damper, or EC fan control. |
| 50 GND 53 GND | Digital ground | Signal ground for digital inputs. |
| 51 DI1b 52 DI2b 54 DI3b 55 DI4b | Digital input | Input used for presence, open window, or change-over detection. |
| Ext. Disp. | External display communication port | 4P4C modular connector used for communication with an ED-RU... room unit. |
| 60 E 61 N 62 A 63 B | RS485 communication port | RS485 connector used for communication via BACnet, or for master/slave communication via Exoline or Modbus. N can be used as common signal reference if a large difference in potential between units in the network is causing communication problems. This connection is not galvanically isolated. |
| 70 E 71 N 72 A 73 B | RS485 communication port | RS485 connector used for communication via BACnet, or for master/slave communication via Exoline or Modbus. N can be used as common signal reference if a large difference in potential between units in the network is causing communication problems. This connection is galvanically isolated. |

Controller connections and wiring diagrams

The wiring diagram in *Figure 7-2* exemplifies controller connections usage.

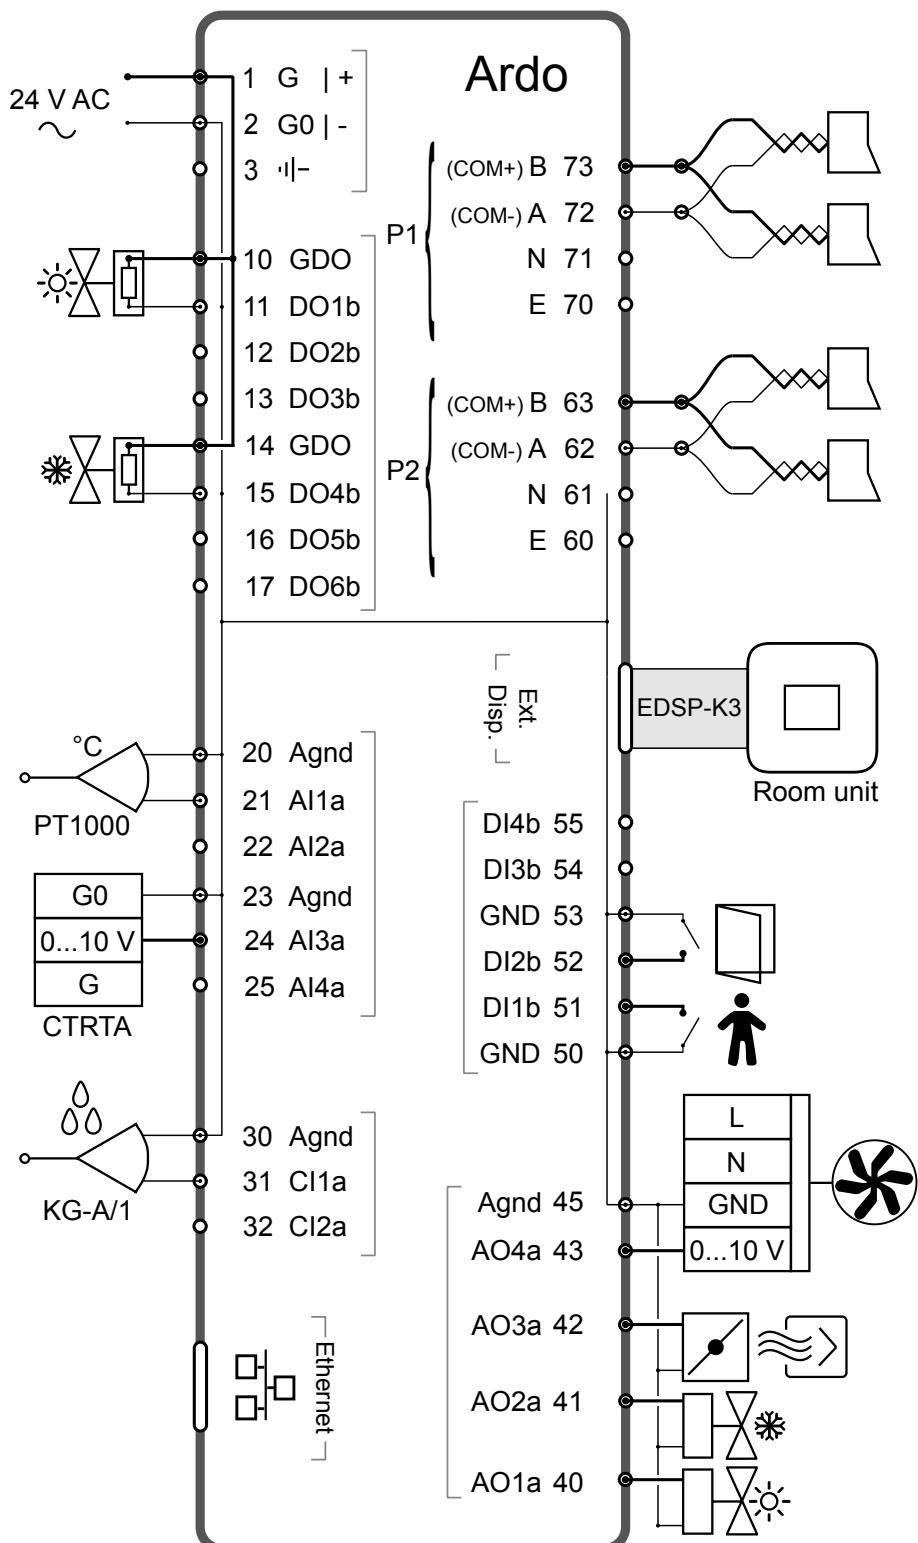

Figure 7-2 Wiring diagram exemplifying controller connections usage.

The ED-RU... room unit is connected to the controller by using a Regin EDSP-K3 cable, as shown in the following wiring diagram.

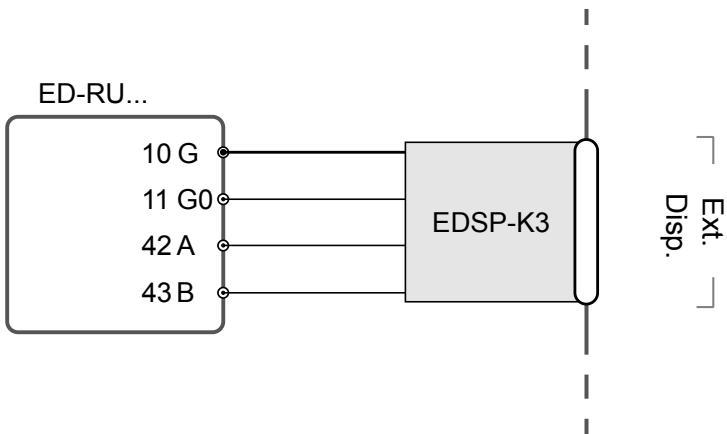

Figure 7-3 Wiring diagram for the ED-RU... room unit.

The following table describes how the EDSP-K3 cable is connected to the room unit.

Table 7-2 ED-RU... room unit terminals and EDSP-K3 wire colors.

| Terminal № and designator | EDSP-K3 wire color |
|---------------------------|--------------------|
| 10 G | Black |
| 11 G0 | White |
| 42 A | Yellow |
| 43 B | Brown |

8 LED status indications

An LED is located at the top of the controller cassette and provides information about the controller status and behaviour.

| LED colour | Description |
|------------------|--|
| Green, solid | Power is on. All is OK. |
| Red, solid | Battery problem. |
| Yellow, blinking | The controller is selected from the list in the <i>Search</i> window in Application tool. The <i>Search</i> window is located in the <i>Tools -> Search for controllers</i> menu in Application tool. |

9 Mounting

The controller is mounted either on a DIN rail, or on a wall above a false ceiling. The controller form factor is EURO norm, which makes it fit into a standard EURO norm cabinet.

Caution! Before installation or maintenance, the power supply should first be disconnected. Installation or maintenance of this unit should only be carried out by qualified personnel. The manufacturer is not responsible for any eventual damage or injury caused by inadequate skills during installation, or through removal of or deactivation of any security devices.

9.1 DIN rail mounting

To mount the controller:

1. Pull out the fastener.
2. Attach the controller to the rail.
3. Push in the fastener to secure the controller.

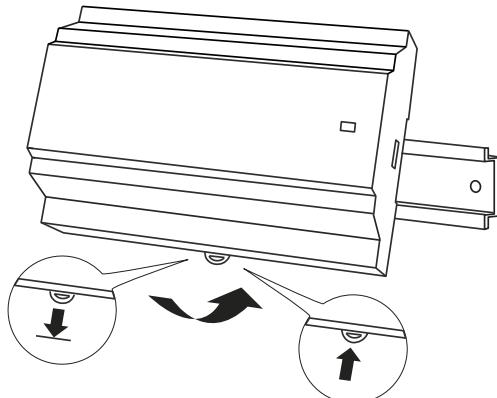

Figure 9-1 Attaching the controller to the DIN rail.

9.2 Wall mounting

To mount the controller:

1. Attach the baseplate to the wall using screws.

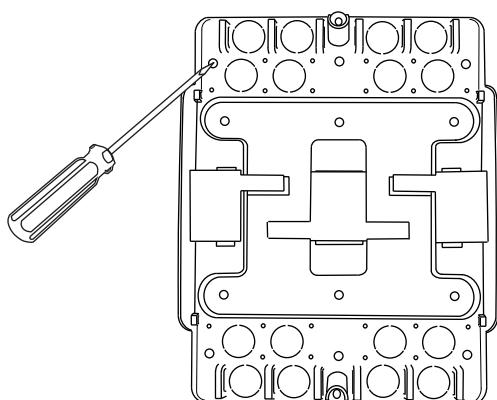

Figure 9-2 Attaching the baseplate to the wall.

Mounting

2. Pull out the fastener and attach the controller to the baseplate, and then push in the fastener to secure the controller.

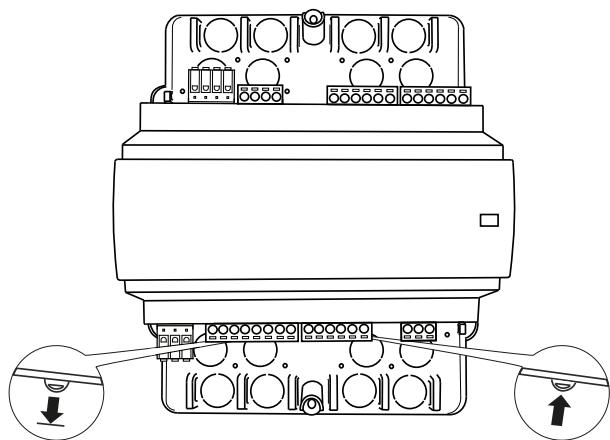

Figure 9-3 Attaching the controller to the baseplate.

3. Attach the terminal protection covers to the baseplate, and then secure the covers using the pre-mounted Torx T20 screws.

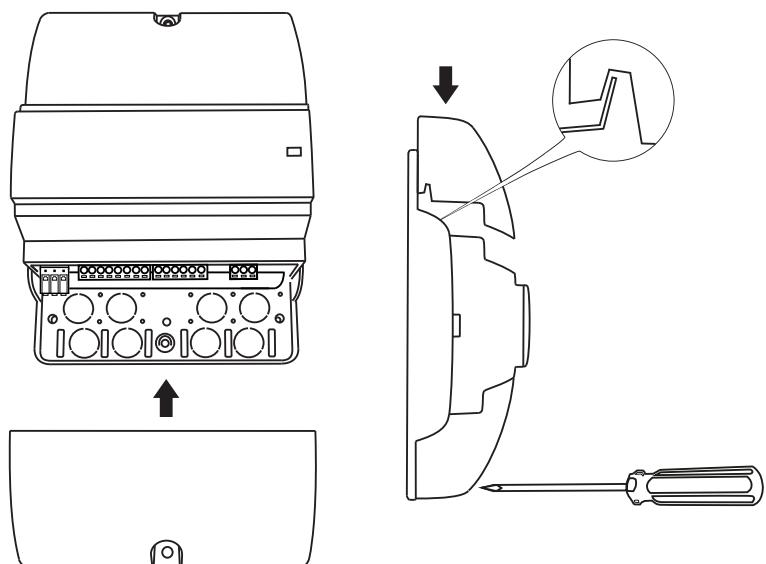

Figure 9-4 Attaching and securing the terminal protection covers.

10 Maintenance and service

Caution! Before installation or maintenance, the power supply should first be disconnected. Installation or maintenance of this unit should only be carried out by qualified personnel. The manufacturer is not responsible for any eventual damage or injury caused by inadequate skills during installation, or through removal of or deactivation of any security devices.

10.1 Changing the battery

Caution! The controller must be disconnected from power before the battery is changed.

To change the battery:

1. Disconnect the controller from power, and then remove the terminal protection covers (if wall mounted).
2. Remove the top of the casing by pressing the two tabs on each side of the casing, and then lift up the top of the casing carefully.

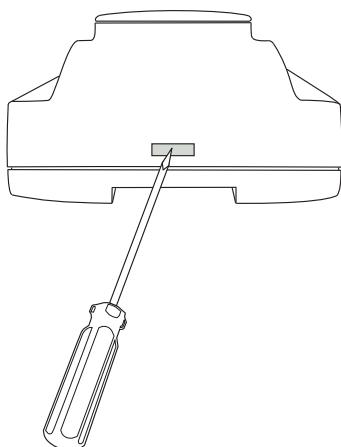

Figure 10-1 Removing the top of the casing.

3. Change the battery. A lithium CR2032 battery is used.
4. Assemble the casing carefully again.
5. Wire the controller, attach the terminal protection covers (if wall mounted), and then power up the controller.

10.2 Resetting the application memory

Caution! This procedure should only be carried out by qualified personnel, since it requires advanced knowledge. The current application will stop running and the controller will return to its default settings which may damage the system.

The controller is reset by pressing the reset button on the side of the casing by using something thin, such as a paper clip. After a reset, the controller starts up again with factory settings applied.

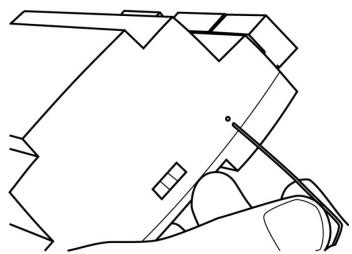

Figure 10-2 Resetting the application memory.

Appendix A Technical data

A.1 General data

| | |
|--|--|
| Supply voltage | 24 V AC (20.4...27.6 V AC) |
| Power consumption without load | < 1 W |
| Memory backup | Backup of memory and real-time clock function |
| Battery type | CR2032 replaceable lithium cell |
| Battery life | Min. 5 years |
| Protection class | IP20 |
| Protection class, with terminal protection covers | IP30 |
| Protection class, electrical | Class III |
| Ambient humidity | Max. 95 % RH (non-condensing) |
| Ambient temperature | 0...55 °C |
| Storage temperature | -20...+70 °C |
| Mounting | Wall, DIN rail |
| Number of DIN modules | 8.5 |
| Weight | 490 g |
| Dimensions, controller unit with terminal blocks (WxHxD) | 149 x 136 x 58 mm |
| Dimensions, controller unit with baseplate and terminal protection covers (WxHxD) | 153 x 202 x 68 mm |
| Cable connections | Pluggable terminal blocks, screw (AI, AO, DI, DO, COM port 2) Pluggable terminal blocks, push-in (supply voltage, COM port 1) |
| Operating system | EXOrealIC |

| Communication ports | RS485 | Ethernet | Total |
|---------------------|-------|----------|-------|
| Count | 2 | 1 | 3 |

| Inputs and outputs | Ala | Dlb | Cla | AOa | DOb | Total |
|--------------------|-----|-----|-----|-----|-----|-------|
| Count | 4 | 4 | 2 | 4 | 6 | 20 |

A.2 Inputs

| | |
|-----------------------------------|--|
| Analogue input a (Ala) | 0...10 V DC, PT1000 |
| Digital input b (Dlb) | Sourcing input type, GND is reference |
| Condensation input a (Cla) | Input dedicated for Regin's condensation detector KG-A/1 |

A.3 Outputs

| | |
|--------------------------------|---|
| Analogue output a (AOa) | 0...10 V DC, max. 5 mA, short-circuit proof |
| Digital output b (DOb) | Mosfet output 24 V AC, max. 2 A, total max. 8 A |

A.4 RS485 communication port 1

| | |
|----------------------------|--|
| Default protocol | EXOline |
| Supported protocols | EXOline, Modbus, BACnet MS/TP |
| Port isolation | Galvanic common mode voltage, max. 150 V |
| Communication speed | 9600 bps (1200...38400 bps) |
| Parity | Even, Odd, None |
| Stop bits | 1 or 2 |

A.5 RS485 communication port 2

| | |
|----------------------------|-------------------------------|
| Default protocol | EXOline |
| Supported protocols | EXOline, Modbus, BACnet MS/TP |
| Port isolation | No |
| Communication speed | 9600 bps (1200...38400 bps) |
| Parity | Even, Odd, None |
| Stop bits | 1 or 2 |

A.6 Ethernet communication port

| | |
|----------------------------|-------------------------------|
| Default protocol | EXOline |
| Supported protocols | EXOline, Modbus IP, BACnet/IP |
| Communication speed | 9600 bps (1200...38400 bps) |

Appendix B Room unit display parameter lists

B.I CTRL

| Parameter | Signal name | Default value | Units | Description |
|-----------|--|---------------|-------|--|
| 1 | RCPSettings.RegioControllerMode | 9 | | Control Mode 0=Heating 1=Heating + Heating 2=Heating + Cooling 3=Cooling 4=Heating/Cooling (change-over) 5=Heating + Heating/Cooling (change-over) 6=Heating + VAV 7=Cooling + VAV 8=VAV 9=Heating + Cooling + VAV |

| 28 | RCPSettings.RegioCCoolExerciseHour | 15 | hour | Hour for exercise cooling valve |
| 29 | RCPSettings.RegioHeatExerciseTime | 120 | sec | Time in seconds to Exercise the Heat Valves |
| 30 | RCPSettings.RegioCoolExerciseTime | 120 | sec | Time in seconds to Exercise the Cool Valves |

| Parameter | Signal name | Default value | Units | Description |
|-----------|--|---------------|-------|--|
| 31 | RCPSettings.RegioCVHeatExerciseDayZone2 | 8 | | Day for exercise heating valve Room2: 0=Never 1-7=mon-sun 8=every day |
| 32 | RCPSettings.RegioCVCoolExerciseDayZone2 | 8 | | Day for exercise cooling valve Room2: 0=Never 1-7=mon-sun 8=every day |
| 33 | RCPSettings.RegioCVHeatExerciseHourZone2 | 15 | hour | Hour for exercise heating valve Room2 |
| 34 | RCPSettings.RegioCVCoolExerciseHourZone2 | 15 | hour | Hour for exercise cooling valve Room2 |
| 35 | RCPSettings.RegioHeatExerciseTimeZone2 | 120 | sec | Time in seconds to Exercise the Heat Valves for Room2 |
| 36 | RCPSettings.RegioCoolExerciseTimeZone2 | 120 | sec | Time in seconds to Exercise the Cool Valves for Room2 |

B.4 FAN

| Parameter | Signal name | Default value | Units | Description |
|-----------|---------------------------------------|---------------|-------|---|
| 1 | RCPSettings.RegioFanControlMode | 0 | | FanControl Mode 0=No control 1=Controlled by Heating 2=Controlled by cooling 3=Controlled by both heat and cooling |
| 2 | RCPSettings.RegioFanSpeed1Start | 20 | % | If higher controller output start fanspeed 1 |
| 3 | RCPSettings.RegioFanSpeed2Start | 60 | % | If higher controller output start fanspeed 2 |
| 4 | RCPSettings.RegioFanSpeed3Start | 100 | % | If higher controller output start fanspeed 3 |
| 5 | RCPSettings.RegioFanSpeedHyst | 5 | % | Hysteresis % for start/stop fan |
| 6 | RCPSettings.RegioRUNoOfFanSpeeds | 3 | | Configured number of fanspeeds (1-3) |
| 7 | RCPSettings.RegioMinFanSpeed | 0 | | Min Speed for the fan: 0=Stop 1=Speed 1 |
| 8 | RCPSettings.RegioFanStopTime | 120 | sec | Time (Sec) for the Fan Stop delay when Fan AfterBlow used |
| 9 | RCPSettings.RegioFanAfterBlowMinSpeed | 0 | | Minimum Fan Speed when FanafterBlow Active |
| 10 | RCPSettings.RegioFanControlModeZone2 | 0 | | FanControl Mode Room2: 0=No control 1=Controlled by Heating 2=Controlled by cooling 3=Controlled by both heat and cooling |
| 11 | RCPSettings.RegioFanSpeed1StartZone2 | 20 | % | If higher controller output start fanspeed 1 Room2 |
| 12 | RCPSettings.RegioFanSpeed2StartZone2 | 60 | % | If higher controller output start fanspeed 2 Room2 |
| 13 | RCPSettings.RegioFanSpeed3StartZone2 | 100 | % | If higher controller output start fanspeed 3 Room2 |
| 14 | RCPSettings.RegioFanSpeedHystZone2 | 5 | % | Hysteresis % for start/stop fan Room2 |
| 15 | RCPSettings.RegioRUNoOfFanSpeedsZone2 | 3 | | Configured number of fanspeeds (1-3) Room2 |
| 16 | RCPSettings.RegioMinFanSpeedZone2 | 0 | | Min Speed for the fan Room2: 0=Stop 1=Speed 1 |

Room unit display parameter lists

| Parameter | Signal name | Default value | Units | Description |
|-----------|--|---------------|-------|---|
| 17 | RCPSettings.RegioFanStopTimeZone2 | 120 | sec | Time (Sec) for the Fan Stop delay when Fan AfterBlow used |
| 18 | RCPSettings.RegioFanAfterBlowMinSpeedZone2 | 0 | | Minimum Fan Speed when FanafterBlow Active |

B.5 M/AT

| Parameter | Signal name | Default value | Units | Description |
|-----------|--|---------------|-------|--|
| 1 | RCPSettings.RegioLightManual | 0 | | Controls the light when central control |
| 2 | RCPSettings.RegioSunBlindsControl | 0 | | Remote Control for the Jalusi: 0=Go In 1=Stop 2=Go out |
| 3 | RCPSettings.RegioLightManualZone2 | 0 | | Controls the light when central control Room2 |
| 4 | RCPSettings.RegioSunBlindsControlZone2 | 0 | | Remote Control for the Jalusi Room2 0=Go In 1=Stop 2=Go out |
| 5 | RCPSettings.RegioHeat1OutputSelect | 2 | | Manual/Auto of Heat1 0=Off 1=Manual 2=Auto |
| 6 | RCPSettings.RegioHeat2OutputSelect | 2 | | Manual/Auto of Heat2 |

B.6 HMI

| Parameter | Signal name | Default value | Units | Description |
|-----------|--|---------------|-------|--|
| 1 | RCPSettings.RegioRUSetPointAdjPos | 3 | °C | Max allowed offset over setpoint |
| 2 | RCPSettings.RegioRUSetPointAdjNeg | 3 | °C | Max allowed offset below setpoint |
| 3 | RCPSettings.RegioRUSetPointAdjPosZone2 | 3 | °C | Max allowed offset over setpoint Room2 |
| 4 | RCPSettings.RegioRUSetPointAdjNegZone2 | 3 | °C | Max allowed offset below setpoint Room2 |
| 5 | RCPSettings.RegioRUType | 9 | | Room Unit attached to the controller: 0=None 1=ED-RU 2=ED-RU-O 3=ED-RU-F 4=ED-RU-FO 5=ED-RU-DO 6=ED-RU-DFO 7=ED-RU-DOS 8=ED-RU-H 9=ED-RU-DOCS 10=ED-RUD |
| 6 | RCPSettings.RegioRUTempUnit | 1 | | Display Unit: 0=None 1=°C 2=°F |

Room unit display parameter lists

| Parameter | Signal name | Default value | Units | Description |
|-----------|--|---------------|-------|---|
| 7 | RCPSettings.RegioRUDisplayViewType | 0 | | Select view mode for the display: 0=Display value 1=Display Value with setpoint adjustment 2=Heat setpoint 3=Cool setpoint 4=Average cool/heat setpoint 5=Only setpoint offset 6=CO2 Level |
| 8 | RCPSettings.RegioRUDisplaySetPointType | 0 | | Select view mode for the display when pressing increase decrease button: 0=Setpoint offset 1=Controlling setpoint 2=Heat setpoint 3=Cool setpoint |
| 9 | RCPSettings.RegioRUButtonsUsed | 7 | | Buttons that can be used in the RU |
| 10 | RCPSettings.RegioRUConfigMenuDisable | 0 | | Enable entering the configuration menu in the RU unit when pressing the UP and Down Key |
| 11 | RCPSettings.RegioRUDisplayBacklightLow | 20 | | Lightning Lo (0-255) |
| 12 | RCPSettings.RegioRUDisplayBacklightHigh | 100 | | Lightning Hi (0-255) |
| 13 | RCPSettings.RegioRUDisplayContrast | 15 | | Contrast (0-15) |
| 14 | RCPSettings.RegioRUTypeZone2 | 9 | | Room Unit attached to the controller Room2: 0=None 1=ED-RU 2=ED-RU-O 3=ED-RU-F 4=ED-RU-FO 5=ED-RU-DO 6=ED-RU-DFO 7=ED-RU-DOS 8=ED-RU-H 9=ED-RU-DOCS 10=ED-RUD |
| 15 | RCPSettings.RegioRUTemperatureCompZone2 | 0 | °C | Temperature Compensation for RU 2 |
| 16 | RCPSettings.RegioRUDisplayViewTypeZone2 | 0 | | Select view mode for the display Room2: 0=Display value 1=Display Value with setpoint adjustment 2=Heat setpoint 3=Cool setpoint 4=Average cool/heat setpoint 5=Only setpoint offset 6=CO2 Level |
| 17 | RCPSettings.RegioRUDisplaySetPointTypeZone2 | 0 | | Select view mode for the display when pressing increase decrease button Room2: 0=Setpoint offset 1=Controlling setpoint 2=Heat setpoint 3=Cool setpoint |
| 18 | RCPSettings.RegioRUButtonsUsedZone2 | 7 | | Buttons that can be used in the RU |
| 19 | RCPSettings.RegioRUConfigMenuDisableZone2 | - | | Enable entering the configuration menu in the RU unit when pressing the UP and Down Key |
| 20 | RCPSettings.RegioRUDisplayBacklightLowZone2 | 20 | | Lightning Lo (0-255) |
| 21 | RCPSettings.RegioRUDisplayBacklightHighZone2 | 100 | | Lightning Hi (0-255) |
| 22 | RCPSettings.RegioRUDisplayContrastZone2 | 15 | | Contrast (0-15) |
| 23 | RCPSettings.RegioForceDisplayID | - | | Forces the Display to identify themselves (show number on display/blink leds), can leave this state by pressing On/Off button |
| 24 | RCPSettings.RegioDisplayIDOnPowerUp | - | | If enabled will show display identification on power for 60 seconds or press of the on/off button |

| Parameter | Signal name | Default value | Units | Description |
|-----------|-------------------------------------|---------------|-------|---|
| 25 | RCPSettings.RegioForceDisplaySearch | - | | Trigger a search for display on display port |
| 26 | RCPSettings.RegioSwapDisplayAddress | - | | Swap the address of the display. RU in Room1 will go to Room2 and ViceVersa. Only possible with two display detected and Dual Zone Active |

B.7 IO

| Parameter | Signal name | Default value | Units | Description |
|-----------|----------------------|---------------|-------|---|
| 1 | RCPSettings.RegioAi1 | 0 | | Configuration for Analog Input 1 0=Disable 1=External room temp 2=ChangeOver temp 3=Outdoor temp 4=Condensation 5=CO2 sensor 6=RH sensor 7=Not used 8=Not used 9=Not used 11=Supply air Temp 101=External room temp room 2 102=Not used 103=Outdoor temp room 2 104=Condensation room 2 105=CO2 sensor room 2 106=RH sensor room 2 107=Not used 108=Not used 109=Not used 111=Supply air temp room 2 |

B.8 ALAM

| Parameter | Signal name | Default value | Units | Description |
|-----------|---|---------------|-------|--|
| 1 | RCPSettings.RegioAlarmHyst | 0.2 | | Alarm hysteresis |
| 2 | RCPSettings.RegioRoomTempHighLimit | 40 | | High room temp |
| 3 | RCPSettings.RegioRoomTempLowLimit | 15 | | Low room temp |
| 4 | RCPSettings.RegioRoomTempMaxDeviationLimit | 20 | | Max allowed difference between setpoint and room temp before alarm |
| 5 | RCPSettings.RegioAlarmHystZone2 | 0.2 | | Alarm hysteresis Room2 |
| 6 | RCPSettings.RegioRoomTempHighLimitZone2 | 40 | | High room temp Room2 |
| 7 | RCPSettings.RegioRoomTempLowLimitZone2 | 15 | | Low room temp Room2 |
| 8 | RCPSettings.RegioRoomTempMaxDeviationLimitZone2 | 20 | | Max allowed difference between setpoint and room temp before alarm Room2 |
| 9 | RCPSettings.RegioCondenseLimit | 80 | | High limit for condense alarm |
| 10 | RCPSettings.RegioCondenseHyst | 2 | | Condense alarm hysteresis |
| 11 | RCPSettings.RegioCondenseLimitZone2 | 80 | | High limit for condense alarm Room2 |
| 12 | RCPSettings.RegioCondenseHystZone2 | 2 | | Condense alarm hysteresis Room2 |
| 13 | RCPSettings.RegioCO2MaxLimit | 1500 | ppm | Max CO2 Level for Alarm |
| 14 | RCPSettings.RegioCO2MaxLimitZone2 | 1500 | ppm | Max CO2 Level for Alarm Room2 |
| 15 | AlaData.AlaPt1_DelayValue | 0 | | Delay value for point no. 1 Condensation |
| 16 | AlaData.AlaPt2_DelayValue | 0 | | Delay value for point no. 2 CondensationZone2 |
| 17 | AlaData.AlaPt3_DelayValue | 0 | | Delay value for point no. 3 SensorAlarm |
| 18 | AlaData.AlaPt4_DelayValue | 0 | | Delay value for point no. 4 SensorAlarmZone2 |
| 19 | AlaData.AlaPt5_DelayValue | 0 | | Delay value for point no. 5 Presence |
| 20 | AlaData.AlaPt6_DelayValue | 0 | | Delay value for point no. 6 OpenWindow |
| 21 | AlaData.AlaPt7_DelayValue | 0 | | Delay value for point no. 7 PresenceZone2 |
| 22 | AlaData.AlaPt8_DelayValue | 0 | | Delay value for point no. 8 OpenWindowsZone2 |
| 23 | AlaData.AlaPt9_DelayValue | 0 | | Delay value for point no. 9 RoomUnitError |
| 24 | AlaData.AlaPt10_DelayValue | 0 | | Delay value for point no. 10 RoomUnitErrorZone2 |
| 25 | AlaData.AlaPt11_DelayValue | 0 | | Delay value for point no. 11 Slave1CommFail |
| 26 | AlaData.AlaPt12_DelayValue | 0 | | Delay value for point no. 12 Slave2CommFail |
| 27 | AlaData.AlaPt13_DelayValue | 0 | | Delay value for point no. 13 Slave3CommFail |
| 28 | AlaData.AlaPt14_DelayValue | 0 | | Delay value for point no. 14 Slave4CommFail |
| 29 | AlaData.AlaPt15_DelayValue | 0 | | Delay value for point no. 15 RoomTempHigh |
| 30 | AlaData.AlaPt16_DelayValue | 0 | | Delay value for point no. 16 RoomTempLow |
| 31 | AlaData.AlaPt17_DelayValue | 0 | | Delay value for point no. 17 RoomTempDeviation |
| 32 | AlaData.AlaPt18_DelayValue | 0 | | Delay value for point no. 18 RoomControllerInManualMode |
| 33 | AlaData.AlaPt19_DelayValue | 0 | | Delay value for point no. 19 RoomTempHighZone2 |
| 34 | AlaData.AlaPt20_DelayValue | 0 | | Delay value for point no. 20 RoomTempLowZone2 |
| 35 | AlaData.AlaPt21_DelayValue | 0 | | Delay value for point no. 21 RoomTempDeviationZone2 |
| 36 | AlaData.AlaPt22_DelayValue | 0 | | Delay value for point no. 22 RoomControllerInManualModeZone2 |

| Parameter | Signal name | Default value | Units | Description |
|-----------|---------------------------|---------------|-------|---|
| 37 | AlaData.Alap23_DelayValue | 0 | | Delay value for point no. 23 MasterCommFail |
| 38 | AlaData.Alap24_DelayValue | 0 | | Delay value for point no. 24 SlaveNormalOperation |
| 39 | AlaData.Alap25_DelayValue | 10 | | Delay value for point no. 25 CO2 Level High |
| 40 | AlaData.Alap26_DelayValue | 10 | | Delay value for point no. 26 CO2 Level High Room2 |
| 41 | Alarms.AlAcknow | 0 | | External acknowledge command |
| 42 | Alarms.AlBlock | 0 | | External blocking command |
| 43 | Alarms.AlUnBlock | 0 | | External unblocking command |

Appendix C Modbus signal lists

C.1 Coil status registers

| Signal name | Modbus address | Default value | Description |
|--|----------------|---------------|--|
| RCPSettings.RegioHeatSequenceOrder | 1 | 0 | Y1 and Y2 for Heat/Heat: 0=Y1 before Y2 1=Y2 before Y1 |
| RCPSettings.RegioCoolSequenceOrder | 2 | 0 | Y2 and Y3 for Heat/Cool/VAV: 0=Y2 before Y3 1=Y3 before Y2 |
| RCPSettings.RegioChangeOverType | 3 | 0 | Type of Changeover used in Room 1: 0=Digital (Thermostat) 1=Analog Temperature in IncomingPipe |
| RCPSettings.RegioForcedVentSequence | 4 | 0 | ForcedVentSequence: 0=Forced Ventilation Just 2nd sequence 1=Force Ventilation both sequences |
| RCPSettings.RegioCO2FirstSequence | 5 | 0 | If enabled in modes 7,8 (cool/cool and heat/cool/vav) the CO2 output will override both outputs if the actual output is lower than the CO2 Output by default it only overrides the second sequence |
| RCPSettings.RegioCO2PresenceDetection | 6 | 1 | Activate presence on CO2 |
| RCPSettings.RegioMinFanSpeed | 7 | 0 | Min Speed for the fan (0=Stop 1=Speed 1) |
| RCPSettings.RegioFanTypeSelector | 8 | 0 | Type of Fan used , needed for display purposes in the RU. 0=3Speed Fan 1=EC Fan |
| RCPSettings.RegioLightManual | 9 | 0 | Controls the light when central control |
| RCPSettings.RegioLightingCmdRemote | 10 | 0 | Remote Light Control |
| RCPSettings.RegioSunBlindsInCmd | 11 | 0 | Command to take in jalusi |
| RCPSettings.RegioSunBlindsOutCmd | 12 | 0 | Command to take out jalusi |
| RCPSettings.RegioEnableZone2 | 13 | 0 | Enables Control in Room2 |
| RCPSettings.RegioHeatSequenceOrderZone2 | 14 | 0 | Y1 and Y2 for Heat/Heat Room2: 0=Y1 before Y2 1=Y2 before Y1 |
| RCPSettings.RegioCoolSequenceOrderZone2 | 15 | 0 | Y2 and Y3 for Heat/Cool/VAV Room2 0=Y2 before Y3 1=Y3 before Y2 |
| RCPSettings.RegioForcedVentSequenceZone2 | 16 | 0 | ForcedVentSequence Room2: 0=Forced Ventilation Just 2nd sequence 1=Force Ventilation both sequences Room2 |
| RCPSettings.RegioCO2FirstSequenceZone2 | 17 | 0 | If enabled in modes 7,8 (cool/cool and heat/cool/vav) the CO2 output will override both outputs if the actual output is lower than the CO2 Output by default it only overrides the second sequence Room2 |
| RCPSettings.RegioCO2PresenceDetectionZone2 | 18 | 1 | Activate presence on CO2 Room2 |
| RCPSettings.RegioMinFanSpeedZone2 | 19 | 0 | Min Speed for the fan Room2: 0=Stop 1=Speed 1 |
| RCPSettings.RegioFanTypeSelectorZone2 | 20 | 0 | Type of Fan used , needed for display purposes in the RU Room2: 0=3 Speed Fan 1=EC-Fan |
| RCPSettings.RegioLightManualZone2 | 21 | 0 | Controls the light when central control Room2 |
| RCPSettings.RegioLightingCmdRemoteZone2 | 22 | 0 | Remote Light Control Room2 |
| RCPSettings.RegioSunBlindsInCmdZone2 | 23 | 0 | Command to take in jalusi Room2 |
| RCPSettings.RegioSunBlindsOutCmdZone2 | 24 | 0 | Command to take out jalusi Room2 |

| Signal name | Modbus address | Default value | Description |
|--|----------------|---------------|---|
| RCPSettings.Regio3PointValveStopSignal | 25 | 0 | If enabled it will stop the output digital signal when full open/close. The signal will stop after 1 minute of full open/close time. This option is applied to all 3 point valves in this system. |
| RCPSettings.RegioPropValveHeat1NCNO | 26 | 0 | Output Type (NC/NO) if puls prop control valves |
| RCPSettings.RegioPropValveHeat2NCNO | 27 | 0 | Output Type (NC/NO) if puls prop control valves |
| RCPSettings.RegioPropValveCool1NCNO | 28 | 0 | Output Type (NC/NO) if puls prop control valves |
| RCPSettings.RegioPropValveCool2NCNO | 29 | 0 | Not used |
| RCPSettings.RegioPropValveHeatCoolNCNO | 30 | 0 | Output Type (NC/NO) if puls prop control valves |
| RCPSettings.RegioPropValveVAVNCNO | 31 | 0 | Output Type (NC/NO) if puls prop control valves |
| RCPSettings.RegioPropValveECFanCNO | 32 | 0 | Output Type (NC/NO) if puls prop control valves |
| RCPSettings.RegioPropValveHeat1NCNOZone2 | 33 | 0 | Output Type (NC/NO) if puls prop control valves Room2 |
| RCPSettings.RegioPropValveHeat2NCNOZone2 | 34 | 0 | Output Type (NC/NO) if puls prop control valves Room2 |
| RCPSettings.RegioPropValveCool1NCNOZone2 | 35 | 0 | Output Type (NC/NO) if puls prop control valves Room2 |
| RCPSettings.RegioPropValveCool2NCNOZone2 | 36 | 0 | Not used |
| RCPSettings.RegioPropValveHeatCoolNCNOZone2 | 37 | 0 | Output Type (NC/NO) if puls prop control valves Room2 |
| RCPSettings.RegioPropValveVAVNCNOZone2 | 38 | 0 | Output Type (NC/NO) if puls prop control valves Room2 |
| RCPSettings.RegioPropValveECFanCNOZone2 | 39 | 0 | Output Type (NC/NO) if puls prop control valves Room2 |
| RCPSettings.RegioSixWayValveSequenceOrder | 40 | 0 | 6-Way Valve Sequence Order: 0=Heat 1st Sequence 1=Heat 2nd Sequence |
| RCPSettings.RegioSixWayValveSequenceOrderZone2 | 41 | 0 | 6-Way Valve Sequence Order Room2: 0=Heat 1st Sequence 1=Heat 2nd Sequence |
| RCPSettings.RegioDi1NC | 42 | 0 | Digital input 1 function : 0=Normaly open 1=normaly closed |
| RCPSettings.RegioDi2NC | 43 | 0 | Digital input 2 function |
| RCPSettings.RegioDi3NC | 44 | 0 | Digital input 3 function |
| RCPSettings.RegioDi4NC | 45 | 0 | Digital input 4 function |
| RCPSettings.RegioRUConfigMenuDisable | 48 | 0 | Enable entering the configuration menu in the RU unit when pressing the UP and Down Key |
| RCPSettings.RegioUseRemoteValues | 49 | 1 | If 1 it will show in the RU the network avalues from the master controller(All controllers Average) if 0 will display i'ts own room temperature |
| RCPSettings.RegioRUConfigMenuDisableZone2 | 50 | 0 | Enable entering the configuration menu in the RU unit when pressing the UP and Down Key |
| RCPSettings.RegioUseRemoteValuesZone2 | 51 | 1 | If 1 it will show in the RU the network avalues from the master controller(All controllers Average) if 0 will display i'ts own room temperature |
| RCPSettings.RegioForceDisplayID | 52 | 0 | Forces the Display to identify themselves(show number on display/blink leds), can leave this state by pressing On/Off button |
| RCPSettings.RegioDisplayIDOnPowerUp | 53 | 0 | If enabled will show display identification on power for 60 seconds or press of the on/off button |
| RCPSettings.RegioForceDisplaySearch | 54 | 0 | Trigger a search for display on display port |
| RCPSettings.RegioSwapDisplayAddress | 55 | 0 | Swap the addres of the display. RU in Room1 will go to Room2 and ViceVersa. Only possible with two display detected and Dual Zone Active |
| RCPSettings.RegioDisable2ndSequence | 56 | 0 | If enabled when Condensation input is active in modes with 2 sequences the 2nd sequence will also be set to 0% |

Modbus signal lists

| Signal name | Modbus address | Default value | Description |
|---|----------------|---------------|---|
| RCPSettings.RegioDisable2ndSequenceZone2 | 57 | 0 | If enabled when Condensation input is active in modes with 2 sequences the 2nd sequence will also be set to 0% Room2 |
| RCPSettings.RegioTcplpMasterAddrCommit | 58 | 1 | - |
| RCPSettings.RegioModbusIpEnable | 59 | 0 | Enables ModBus IP |
| RCPSettings.RegioBACnetIpEnable | 60 | 1 | Enables BACnet IP datalink |
| RCPSettings.RegioLogActive | 61 | 1 | Activate log function for EXOScada |
| RCPSettings.RegioAutoSummerTime | 62 | 1 | Switch automatically between summer and winter time |
| RCPSettings.RegioRemovableWallsMaster | 63 | 0 | Set to 1 to enable master Multiple Controllers on Port Define on RemovableWallsCommPort |
| RCPSettings.RegioRemovableWallsSlave | 64 | 0 | Set to 1 to enable slave Multiple Controllers on Port Define on RemovableWallsCommPort |
| RCPSettings.RegioUseMasterValues | 65 | 0 | Set to 1 to enable Removable walls but only use the master sensors values to feed into the control loop |
| RCPSettings.RegioRemoteRoomTempSelect | 66 | 0 | Room Temperature Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteAIChangeOverSelect | 67 | 0 | ChangeOver Temperature Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteOutDoorTempSelect | 68 | 0 | Outdoor Temperature Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteCondenseSelect | 69 | 0 | Condensation Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteRoomCO2Select | 70 | 0 | CO2 Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteRoomRHSelect | 71 | 0 | RH Temperature Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteSupplyAirSelect | 72 | 0 | Supply Air Temperature Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteRoomTempZone2Select | 73 | 0 | Room Temperature Room2 Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteOutDoorTempZone2Select | 74 | 0 | Outdoor Temperature Room2 Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteCondenseZone2Select | 75 | 0 | Condensation Room2 Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteRoomCO2Zone2Select | 76 | 0 | CO2 Room2 Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteRoomRHZone2Select | 77 | 0 | RH Room2 Temperature Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteSupplyAirTempZone2Select | 78 | 0 | Supply Air Room2 Temperature Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteDIOpenWindowSelect | 79 | 0 | Open Window Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |

| Signal name | Modbus address | Default value | Description |
|---|----------------|---------------|---|
| RCPSettings.RegioRemoteDIPresenceSelect | 80 | 0 | Presence Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteDIChangeoverSelect | 81 | 0 | ChangeOver State Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteDICondenseAlarmSelect | 82 | 0 | Condensation State Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteDIOpenWindowZone2Select | 83 | 0 | Open Window Room2 Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteDIPresenceZone2Select | 84 | 0 | Presence Room2 Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteDICondenseAlarmZone2Select | 85 | 0 | Condensation Room2 State Source Selector: 0=Use Controller Input Values 1=use remote values (Exoline/Modbus/Bacnet) |
| RCPSettings.RegioRemoteDIOpenWindow | 86 | 0 | Communication Open Window State |
| RCPSettings.RegioRemoteDIPresence | 87 | 0 | Communication Presence State |
| RCPSettings.RegioRemoteDIChangeover | 88 | 0 | Communication ChangeOver State |
| RCPSettings.RegioRemoteDICondenseAlarm | 89 | 0 | Communication Condensation State |
| RCPSettings.RegioRemoteDIOpenWindowZone2 | 90 | 0 | Communication Open Window Room2 State |
| RCPSettings.RegioRemoteDIPresenceZone2 | 91 | 0 | Communication Presence Room2 State |
| RCPSettings.RegioRemoteDICondenseAlarmZone2 | 92 | 0 | Communication Condensation Room2 State |

C.2 Input registers

| Signal name | Modbus address | Scale | Description |
|---------------------------------|----------------|-------|-------------------------------------|
| RCPActual.RegioSoftware | 1 | 1 | Type of Regio software (0=RPC) |
| RCPActual.RegioVerMajor | 2 | 1 | Major Version |
| RCPActual.RegioVerMinor | 3 | 1 | Minor Version |
| RCPActual.RegioVerBranch | 4 | 1 | Branch Version (0=Beta, 1=Official) |
| RCPActual.RegioRevision | 5 | 1 | Revision |
| RCPActual.RegioRoomTempExt | 6 | 10 | Room temp external sensor |
| RCPActual.RegioAIChangeOverTemp | 7 | 10 | Change over |
| RCPActual.RegioOutdoorTemp | 8 | 10 | Outdoor temp |
| RCPActual.RegioCondensation | 9 | 1 | Condense |
| RCPActual.RegioRoomCO2 | 10 | 1 | Room CO2 |
| RCPActual.RegioRoomRH | 11 | 1 | Room RH |
| RCPActual.RegioSupplyAirTemp | 12 | 10 | SupplyAir Temperature |
| RCPActual.RegioAnaOut1 | 13 | 1 | Analog output 1 |
| RCPActual.RegioAnaOut2 | 14 | 1 | Analog output 2 |
| RCPActual.RegioAnaOut3 | 15 | 1 | Analog output 1 |
| RCPActual.RegioAnaOut4 | 16 | 1 | Analog output 2 |
| RCPActual.RegioHeatSeq1 | 17 | 1 | Control valve Heating 1 |

Modbus signal lists

| Signal name | Modbus address | Scale | Description |
|---------------------------------------|----------------|-------|---|
| RCPActual.RegioHeatSeq2 | 18 | 1 | Control valve Heating 2 |
| RCPActual.RegioCoolSeq1 | 19 | 1 | Control valve Cooling 1 |
| RCPActual.RegioCoolSeq2 | 20 | 1 | Not used |
| RCPActual.RegioHeatCoolOutput | 21 | 1 | Control valve Heating/Cooling |
| RCPActual.RegioVAVOutput | 22 | 1 | Control VAV damper |
| RCPActual.RegioECFanOutput | 23 | 1 | Control EC Fan |
| RCPActual.RegioRoomTemp | 24 | 10 | Roomtemp internal or external |
| RCPActual.RegioControlState | 25 | 1 | Current unit state: 0=Off 1=Unoccupied 2=Stand-by 3=Occupied 4=ByPass |
| RCPActual.RegioHeatCoolSymbol | 26 | 1 | Current controller state: 0=Off 1=Heating 2=Cooling 3=Heating and Cooling |
| RCPActual.RegioPIDSetP | 27 | 10 | Setpoint Sent to PID |
| RCPActual.RegioSetPAdjustment | 28 | 10 | Setpoint Adjustment |
| RCPActual.RegioHeatOutput | 29 | 1 | Control signal Heating 0-100 % |
| RCPActual.RegioCoolOutput | 30 | 1 | Control signal Cooling 0-100 % |
| RCPActual.RegioVAVOutputSignal | 31 | 1 | Control signal VAV 0-100% |
| RCPActual.RegioECFanOutputSignal | 32 | 1 | Control signal EC fan 0-100% |
| RCPActual.RegioFanSpeed | 33 | 1 | Current 3speed fan speed: 0=Off 1=Speed1 2=Speed2 3=Speed3 |
| RCPActual.RegioECFanSpeedIndex | 34 | 1 | Current EC fan speed converted to index, used in RU: 0=Off 1=Speed1 2=Speed2 3=Speed3 |
| RCPActual.RegioFanSpeedSelectCombined | 35 | 1 | Fan speed Selected: 0=Off 1=Speed1 2=Speed2 3=Speed3 4=Auto |
| RCPActual.RegioByPassRunMin | 36 | 1 | Time left in ByPass mode (min) |
| RCPActual.RegioMasterSlaveState | 37 | 1 | Current State in Removable Walls Feature: 0=StandAlone 1=Master 2=Slave 3=Slave with comm error running as standalone |
| RCPActual.RegioRoomTempExtZone2 | 38 | 10 | Room temp external sensor Room2 |
| RCPActual.RegioOutDoorTempZone2 | 39 | 10 | Outdoor temp Room2 |
| RCPActual.RegioCondensationZone2 | 40 | 1 | Condense Room2 |
| RCPActual.RegioRoomCO2Zone2 | 41 | 1 | Room CO2 Room2 |
| RCPActual.RegioRoomRHZone2 | 42 | 1 | Room RH Room2 |
| RCPActual.RegioSupplyAirTempZone2 | 43 | 10 | SupplyAir Temperature Room2 |
| RCPActual.RegioHeatSeq1Zone2 | 44 | 1 | Control valve Heating 1 Room2 |
| RCPActual.RegioHeatSeq2Zone2 | 45 | 1 | Control valve Heating 2 Room2 |

| Signal name | Modbus address | Scale | Description |
|--|----------------|-------|---|
| RCPActual.RegioCoolSeq1Zone2 | 46 | 1 | Control valve Cooling 1 Room2 |
| RCPActual.RegioCoolSeq2Zone2 | 47 | 1 | Not used |
| RCPActual.RegioHeatCoolOutputZone2 | 48 | 1 | Control valve Heating/Cooling Room2 |
| RCPActual.RegioVAVOutputZone2 | 49 | 1 | Control VAV damper Room2 |
| RCPActual.RegioECFanOutputZone2 | 50 | 1 | Control EC Fan Room2 |
| RCPActual.RegioRoomTempZone2 | 51 | 10 | Roomtemp internal or external |
| RCPActual.RegioPIDOutputZone2 | 52 | 1 | Controller output Room2 |
| RCPActual.RegioControlStateZone2 | 53 | 1 | Current unit state Room2: 0=Off 1=Unoccupied 2=Stand-by 3=Occupied 4=ByPass |
| RCPActual.RegioHeatCoolSymbolZone2 | 54 | 1 | Current controller state Room2: 0=Off, 1=Heating 2=Cooling 3=Heating and Cooling |
| RCPActual.RegioPIDSetPZone2 | 55 | 10 | Setpoint Sent to PID Room2 |
| RCPActual.RegioSetPAdjustmentZone2 | 56 | 10 | Setpoint Adjustment for Room2 |
| RCPActual.RegioHeatOutputZone2 | 57 | 1 | Control signal Heating 0-100 % Room2 |
| RCPActual.RegioCoolOutputZone2 | 58 | 1 | Control signal Cooling 0-100 % Room2 |
| RCPActual.RegioVAVOutputSignalZone2 | 59 | 1 | Control signal VAV 0-100% Room2 |
| RCPActual.RegioECFanOutputSignalZone2 | 60 | 1 | Control signal EC fan 0-100% Room2 |
| RCPActual.RegioFanSpeedZone2 | 61 | 1 | Current 3speed fan speed Room2: 0=Off 1=Speed1 2=Speed2 3=Speed3 |
| RCPActual.RegioECFanSpeedIndexZone2 | 62 | 1 | Current EC fan speed converted to index, used in RU Room2: 0=Off 1=Speed1 2=Speed2 3=Speed3 |
| RCPActual.RegioFanSpeedSelectCombinedZone2 | 63 | 1 | Fan speed Selected Room2: 0=Off 1=Speed1 2=Speed2 3=Speed3 4=Auto |
| RCPActual.RegioByPassRunMinZone2 | 64 | 1 | Time left in ByPass mode (min) Room2 |
| RCPActual.RegioRoomTempAverage | 65 | 10 | Average Roomtemp internal or external |
| RCPActual.RegioAIChangeOverAverage | 66 | 10 | Average Change over Temperature |
| RCPActual.RegioOutDoorTempAverage | 67 | 10 | Average Temperature from all controllers |
| RCPActual.RegioCondenseAverage | 68 | 1 | Condense Average |
| RCPActual.RegioRoomCO2Average | 69 | 1 | Average CO2 from all controllers |
| RCPActual.RegioRoomRHAverage | 70 | 1 | Average Humidity from all controllers |
| RCPActual.RegioSupplyAirTempAverage | 71 | 10 | SupplyAir Temperature from all controllers |
| RCPActual.RegioSetpointOffsetCombined | 72 | 10 | Setpoint OffSet , last changed offset from all controllers |

C.3 Holding registers

| Signal name | Modbus address | Default value | Scale | Description |
|--|----------------|---------------|-------|--|
| RCPSettings.RegioControllerMode | 1 | 9 | 1 | Control Mode 0=Heating 1=Heating + Heating 2=Heating + Cooling 3=Cooling 4=Heating/Cooling (change-over) 5=Heating + Heating/Cooling (change-over) 6=Heating + VAV 7=Cooling + VAV 8=VAV 9=Heating + Cooling + VAV |
| RCPSettings.RegioHeatSetPointOccupied | 2 | 22 | 10 | Room Base setpoint heating |
| RCPSettings.RegioCoolSetPointOccupied | 3 | 24 | 10 | Room Base setpoint cooling |
| RCPSettings.RegioRoomTempPBand | 4 | 10 | 1 | Temperature PID P Band |
| RCPSettings.RegioRoomTempITime | 5 | 300 | 1 | Temperature PID I Time |
| RCPSettings.RegioHeatSetPointUnoccupied | 6 | 15 | 10 | Setpoint heating in Unoccupied |
| RCPSettings.RegioCoolSetPointUnoccupied | 7 | 30 | 10 | Setpoint Cooling in Unoccupied |
| RCPSettings.RegioSetPointDeadBandStandby | 8 | 3 | 10 | Deadband in Standby mode |
| RCPSettings.RegioFrostProtectionSetPoint | 9 | 8 | 10 | Setpoint frostprotection |
| RCPSettings.RegioRUSetPointAdjPos | 10 | 3 | 1 | Max allowed offset over setpoint |
| RCPSettings.RegioRUSetPointAdjNeg | 11 | 3 | 1 | Max allowed offset below setpoint |
| RCPSettings.RegioSetPOffset | 12 | 0 | 10 | Setpoint Offset |
| RCPSettings.RegioSetPOffsetRemote | 13 | 0 | 10 | Setpoint Offset Remote |
| RCPSettings.RegioControllerStateReturn | 14 | 3 | 1 | Select return unit state: 0=Off 1=Unoccupied 2=Stand-by 3=Occupied |
| RCPSettings.RegioControllerStateShutDown | 15 | 1 | 1 | Select shutdown state : 0=Off 1=Unoccupied 2=Stand-by 3=Occupied |
| RCPSettings.RegioControllerStatePresence | 16 | 4 | 1 | Presence operating mode: 3=Occupied 4=ByPass |
| RCPSettings.RegioControllerStateRemote | 17 | 5 | 1 | Is used for remote control: 0=Off 1=Unoccupied 2=Stand-by 3=Occupied 5=No remote control |

C.4 Input status registers

| Signal name | Modbus address | Description |
|-----------------------------------|----------------|-------------------------------|
| RCPActual.RegioOpenWindowInd | 1 | Open window indication |
| RCPActual.RegioCondensationAlarm | 2 | Alarm Condensation indication |
| RCPActual.RegioPresencelnd | 3 | Pressens indication |
| RCPActual.RegioChangeOverInd | 4 | Change over indication |
| RCPActual.RegioDigOut1 | 5 | Digital output 1 |
| RCPActual.RegioDigOut2 | 6 | Digital output 2 |
| RCPActual.RegioDigOut3 | 7 | Digital output 3 |
| RCPActual.RegioDigOut4 | 8 | Digital output 4 |
| RCPActual.RegioDigOut5 | 9 | Digital output 5 |
| RCPActual.RegioDigOut6 | 10 | Digital output 6 |
| RCPActual.RegioFanSpeed1Output | 11 | Start Fan Speed 1 |
| RCPActual.RegioFanSpeed2Output | 12 | Start Fan Speed 2 |
| RCPActual.RegioFanSpeed3Output | 13 | Start Fan Speed 3 |
| RCPActual.RegioLightingOutput | 14 | Start signal Lighting |
| RCPActual.RegioSunBlindsInOutput | 15 | In signal Blind |
| RCPActual.RegioSunBlindsOutOutput | 16 | Out signal Blind |
| RCPActual.RegioForcedVentOutput | 17 | Start forced ventilation |
| RCPActual.RegioHeat1IncOutput | 18 | Increase heat 1 valve |

Modbus signal lists

| Signal name | Modbus address | Description |
|---|----------------|--|
| RCPActual.RegioHeat1DecOutput | 19 | Decrease heat 1 valve |
| RCPActual.RegioHeat1PulsPropOutput | 20 | Puls prop heat 1 valve |
| RCPActual.RegioHeat2IncOutput | 21 | Increase heat 2 valve |
| RCPActual.RegioHeat2DecOutput | 22 | Decrease heat 2 valve |
| RCPActual.RegioHeat2PulsPropOutput | 23 | Puls prop heat 2 valve |
| RCPActual.RegioCool1IncOutput | 24 | Increase cool 1 valve |
| RCPActual.RegioCool1DecOutput | 25 | Decrease cool 1 valve |
| RCPActual.RegioCool1PulsPropOutput | 26 | Puls prop cool 1 valve |
| RCPActual.RegioCool2IncOutput | 27 | Not used |
| RCPActual.RegioCool2DecOutput | 28 | Not used |
| RCPActual.RegioCool2PulsPropOutput | 29 | Not used |
| RCPActual.RegioHeatCoolIncOutput | 30 | Increase Heat cool valve |
| RCPActual.RegioHeatCoolDecOutput | 31 | Decrease Heat cool valve |
| RCPActual.RegioHeatCoolPulsPropOutput | 32 | Puls prop Heat cool valve |
| RCPActual.RegioSumAlarm | 33 | Sum alarm |
| RCPActual.RegioSumAlarmA | 34 | Sum alarm A |
| RCPActual.RegioSumAlarmB | 35 | Sum alarm B |
| RCPActual.RegioRoomTempControlState | 36 | Current controller state: 0=Heating 1=Cooling |
| RCPActual.RegioSunBlindsState | 37 | Blind Position: 0=In 1=Out |
| RCPActual.RegioPresence | 38 | Presence indication |
| RCPActual.RegioCO2Presence | 39 | Is set if presence if CO2 is high |
| RCPActual.RegioAIChangeOverState | 40 | Is set if change over from analog input |
| RCPActual.RegioChangeOverState | 41 | Is set if change over |
| RCPActual.RegioRoomTempSensorAlarm | 42 | Is set if sensor alarm on room sensor (Internal or external) |
| RCPActual.RegioTimeGroupOcc | 43 | Time Group 'Occupied' (No. 1). |
| RCPActual.RegioTimeGroupUnOcc | 44 | Time Group 'UnOccupied' (No. 2). |
| RCPActual.RegioTimeGroupLighting | 45 | Time Group 'Lighting' (No. 3). |
| RCPActual.RegioOpenWindowIndZone2 | 46 | Open window indication Room2 |
| RCPActual.RegioCondensationAlarmZone2 | 47 | Alarm Condens indication Room2 |
| RCPActual.RegioPresenceIndZone2 | 48 | Pressens indication Room2 |
| RCPActual.RegioFanSpeed1OutputZone2 | 49 | Start Fan Speed 1 Room2 |
| RCPActual.RegioFanSpeed2OutputZone2 | 50 | Start Fan Speed 2 Room2 |
| RCPActual.RegioFanSpeed3OutputZone2 | 51 | Start Fan Speed 3 Room2 |
| RCPActual.RegioLightingOutputZone2 | 52 | Start signal Lighting Room2 |
| RCPActual.RegioSunBlindsInOutputZone2 | 53 | In signal Blind Room2 |
| RCPActual.RegioSunBlindsOutOutputZone2 | 54 | Out signal Blind Room2 |
| RCPActual.RegioForcedVentOutputZone2 | 55 | Start forced ventilation Room2 |
| RCPActual.RegioHeat1IncOutputZone2 | 56 | Increase heat 1 valve Room2 |
| RCPActual.RegioHeat1DecOutputZone2 | 57 | Decrease heat 1 valve Room2 |
| RCPActual.RegioHeat1PulsPropOutputZone2 | 58 | Puls prop heat 1 valve Room2 |
| RCPActual.RegioHeat2IncOutputZone2 | 59 | Increase heat 2 valve Room2 |

| Signal name | Modbus address | Description |
|--|----------------|--|
| RCPActual.RegioHeat2DecOutputZone2 | 60 | Decrease heat 2 valve Room2 |
| RCPActual.RegioHeat2PulsPropOutputZone2 | 61 | Puls prop heat 2 valve Room2 |
| RCPActual.RegioCool1IncOutputZone2 | 62 | Increase cool 1 valve Room2 |
| RCPActual.RegioCool1DecOutputZone2 | 63 | Decrease cool 1 valve Room2 |
| RCPActual.RegioCool1PulsPropOutputZone2 | 64 | Puls prop cool 1 valve Room2 |
| RCPActual.RegioCool2IncOutputZone2 | 65 | Not used |
| RCPActual.RegioCool2DecOutputZone2 | 66 | Not used |
| RCPActual.RegioCool2PulsPropOutputZone2 | 67 | Not used |
| RCPActual.RegioHeatCoolIncOutputZone2 | 68 | Increase Heat cool valve Room2 |
| RCPActual.RegioHeatCoolDecOutputZone2 | 69 | Decrease Heat cool valve Room2 |
| RCPActual.RegioHeatCoolPulsPropOutputZone2 | 70 | Puls prop Heat cool valve Room2 |
| RCPActual.RegioSumAlarmZone2 | 71 | Sum alarm |
| RCPActual.RegioSumAlarmAZone2 | 72 | Sum alarm A |
| RCPActual.RegioSumAlarmBZone2 | 73 | Sum alarm B |
| RCPActual.RegioPIDAlaManualZone2 | 74 | Alarm Output: The Regulator is in Manual mode Room2 |
| RCPActual.RegioRoomTempControlStateZone2 | 75 | Current controller state Room2: 0=Heating 1=Cooling |
| RCPActual.RegioSunBlindsStateZone2 | 76 | Blind Position Room2: 0=In 1=Out |
| RCPActual.RegioPresenceZone2 | 77 | Presence indication Room2 |
| RCPActual.RegioCO2PresenceZone2 | 78 | Is set if presence if CO2 is high Room2 |
| RCPActual.RegioAIChangeOverStateZone2 | 79 | Is set if change over from analog input Room2 |
| RCPActual.RegioChangeOverStateZone2 | 80 | Is set if change over Room2 |
| RCPActual.RegioRoomTempSensorAlarmZone2 | 81 | Is set if sensor alarm on room sensor (Internal or external) Room2 |
| RCPActual.RegioTimeGroupOccZone2 | 82 | Time Group 'Occupied' (No. 1). Room2 |
| RCPActual.RegioTimeGroupUnOccZone2 | 83 | Time Group 'UnOccupied' (No. 2). Room2 |
| RCPActual.RegioTimeGroupLightingZone2 | 84 | Time Group 'Lighting' (No. 3). Room2 |
| RCPActual.RegioExerciseOnHeat1 | 85 | Valve Heat 1 in exercise |
| RCPActual.RegioExerciseOnHeat2 | 86 | Valve Heat 2 in exercise |
| RCPActual.RegioExerciseOnCool1 | 87 | Valve Cool 1 in exercise |
| RCPActual.RegioExerciseOnCool2 | 88 | Not used |
| RCPActual.RegioExerciseOnHeatCool | 89 | Valve HeatCool in exercise |
| RCPActual.RegioExerciseOnHeat1Zone2 | 90 | Valve Heat 1 in exercise |
| RCPActual.RegioExerciseOnHeat2Zone2 | 91 | Valve Heat 2 in exercise |
| RCPActual.RegioExerciseOnCool1Zone2 | 92 | Valve Cool 1 in exercise |
| RCPActual.RegioExerciseOnCool2Zone2 | 93 | Not used |
| RCPActual.RegioExerciseOnHeatCoolZone2 | 94 | Valve HeatCool in exercise |
| RCPActual.RegioDIOpenWindowCombined | 95 | Open window indication all Controllers |
| RCPActual.RegioDICondenseAlarmCombined | 96 | Alarm Condens indication all Controllers |
| RCPActual.RegioDIPresenceCombined | 97 | Pressens indication all Controllers (This is the combination of all pins not actualy the presence state) |
| RCPActual.RegioDIChangeoverCombined | 98 | Change over indication all Controllers |

Appendix D BACnet signal lists

D.1 Multistate values

| Signal name | Object name | Instance number | Writable | Description |
|---|---------------------------------|-----------------|----------|---|
| RCPSettings.RegioControllerMode | RegioControllerMode | 40001 | NO | Control Mode 1=Heating 2=Heating + Heating 3=Heating + Cooling 4=Cooling 5=Heating/Cooling (change-over) 6=Heating + Heating/Cooling (change-over) 7=Heating + VAV 8=Cooling + VAV 9=VAV 10=Heating + Cooling + VAV |
| RCPSettings.RegioControllerStateRemote | RegioControllerStateRemote | 30010 | YES | Is used for remote control 1=Off 2=Unoccupied 3=Stand-by 4=Occupied 6>No remote control |
| RCPSettings.RegioChangeOverSelect | RegioChangeOverSelect | 30017 | YES | Select Change Over 1=Heating 2=Cooling 3=Auto |
| RCPSettings.RegioFanAfterBlowMinSpeed | RegioFanAfterBlowMin-Speed | 30030 | YES | Minimum Fan Speed when FanafterBlow Active 1=Off 2=Speed1 3=Speed2 4=Speed3 |
| RCPSettings.RegioLightControlFunction | RegioLightControlFunction | 30031 | YES | Select light control function 1=Central controlled 2=Local Time controlled 3=Presence controlled 4=Time or Presence controlled 5=Central controlled or Presence controlled |
| RCPSettings.RegioSunBlindsControl | RegioSunBlindsControl | 30032 | YES | Remote Control for the Jaluši 1=Go In 2=Stop 3=Go out |
| RCPSettings.RegioControllerModeZone2 | RegioControllerMode-Zone2 | 40002 | NO | Control Mode (Room2) 1=Heating 2=Heating + Heating 3=Heating + Cooling 4=Cooling 5=Heating/Cooling (change-over) 6=Heating + Heating/Cooling (change-over) 7=Heating + VAV 8=Cooling + VAV 9=VAV 10=Heating + Cooling + VAV |
| RCPSettings.RegioControllerStateRemoteZone2 | RegioControllerStateRemoteZone2 | 30042 | YES | Is used for remote control Zone2 1=Off 2=Unoccupied 3=Stand-by 4=Occupied 6>No remote control |
| RCPSettings.RegioFanAfterBlowMinSpeedZone2 | RegioFanAfterBlowMinSpeedZone2 | 30059 | YES | Minimum Fan Speed when FanafterBlow Active Room2: 1=Off 2=Speed1 3=Speed2 4=Speed3 |

| Signal name | Object name | Instance number | Writable | Description |
|--|--------------------------------|-----------------|----------|---|
| RCPSettings.RegioLightControlFunctionZone2 | RegioLightControlFunctionZone2 | 30060 | YES | Select light control function Room2 1=Central controlled 2=Local Time controlled 3=Presence controlled 4=Time or Presence controlled 5=Central controlled or Presence controlled |
| RCPSettings.RegioSunBlindsControlZone2 | RegioSunBlindsControlZone2 | 30061 | YES | Remote Control for the Jaluši Room2 1=Go In 2=Stop 3=Go out |
| RCPSettings.RegioHeat1OutputSelect | RegioHeat1OutputSelect | 30080 | YES | Manual/Auto of Heat1 1=Off 2=Manual 3=Auto |
| RCPSettings.RegioHeat2OutputSelect | RegioHeat2OutputSelect | 30081 | YES | Manual/Auto of Heat2 1=Off 2=Manual 3=Auto |
| RCPSettings.RegioCoolOutputSelect | RegioCoolOutputSelect | 30082 | YES | Manual/Auto of Cool1 1=Off 2=Manual 3=Auto |
